

# STATE OF MILDURA RURAL CITY REPORT 2018

Mildura Rural City Council

# Acknowledgements

The research and development of the *2018 State of Mildura Rural City Report* has occurred over a 12 month period and benefitted from the knowledge and investment of many people. Our gratitude is extended to:

- Mildura Rural City Council
- Northern Mallee Community Partnership
- The Hands Up Mallee collective
- Nancy Vaughan Research
- Key local organisations who generously gave their time and data including Mallee Family Care, Headspace Mildura, Mildura Base Hospital, Mallee District Aboriginal Service
- Key local departmental staff who generously gave their time and data including the Department of Education Training, Mallee Child and Youth Area Partnership, Department of Health and Human Services

Rachael Williams

# Executive Summary

*The State of Mildura Rural City Report 2018* was commissioned by Mildura Rural City Council who, in doing so, recognised the critical importance of understanding how their entire community were faring.

*The State of Mildura Rural City Report 2018*, commenced as a 'State of Health' report to inform and support the development of the Mildura Rural City Council Community Health and Well-Being Plan. Early in the life of this process however it was realised that two further key municipal-wide statistical profiles were almost due for renewal – the *2014 State of Mildura Rural City's Children and Young People Report* and the *2012 Social Indicators Report*. Recognising the potential for overlaps between these three reports and the replication of measures across them the Project Control Group agreed to combine them into a 'master' report – the *State of Mildura Rural City Report*.

The State of Mildura Rural City Report Project Control Group, comprised of representatives from Mildura Rural City Council, the Hands Up Mallee collective, Healthy Together Mildura and Northern Mallee Community Partnership, worked alongside the report researcher to compile a comprehensive list of measures which retained those measures from the *2014 State of Mildura Rural City's Children and Young People Report* and the *2012 Social Indicators Report* and added other measures considered to be significant to the municipal 'story'.

The framework for organising these collated measures was based on the Department of Health and Human Services' *Victorian public health & wellbeing outcomes framework 2016*, applying the established 'Domain' categories of:

- Domain 1: Victorians are healthy and well
- Domain 2: Victorians are safe and secure
- Domain 3: Victorians have the capabilities to participate
- Domain 4: Victorians are connected to culture and community
- Domain 5: Victoria is liveable

To these categories the report added four additional categories:

- Population & Housing Overview – Municipal Contextual Data
- Health Screening and Checks
- Supporting all abilities and ages
- Service Accessibility and Utilisation

These nine overarching categories were also aligned with the *Mildura Rural City Council Health & Wellbeing Plan 2013-2017* pillars of Social, Economic, Built and Natural Environment.

With the measures identified and the organising framework in place each measure was 'filled' – largely at the LGA level but in some instances and the broader Mallee Region level or the more refined SA2, SA1 or postcode level (further detail about the geographical methodology is contained in Appendix 2 of this report). Where ever possible the 'local' results for this measure were held against the Victorian results and also against previous results to provide both a point of comparison and a time trend.

Importantly comprehensive and accurate knowledge of how our community are currently faring together with the direction in which these measures are trending are the basis for informed and coordinated community-wide planning. The *2018 State of Mildura Rural City Report* is the foundation not only for ongoing conversations in existing partnerships but also for new conversations and new partnerships and, in commissioning this Report, Council extends the invitation to all in joining this dialogue.

As a starting point the reader is referred to the table on the ensuing pages. This quick reference guide documents each measure (within its domain) and presents the current Mildura LGA results, alongside their Victorian peers and the local time trend (as indicated by the colour coded arrow). In the far right column the corresponding page number for each measure is also listed allowing the reader to delve further into the details of the measure quickly and easily at any point.

## HOW TO READ THE 2018 STATE OF MILDURA RURAL CITY REPORT

The 2018 State of Mildura Rural City Report applies the same presentation style of its (part) predecessor the *2014 State of Mildura Rural City's Children and Young People Report*.

Once again the 'traffic light' system was applied – where the Mildura LGA results were coded either green, amber or red according to how they were faring in comparison to their state counterparts (more positively, similar to, or less positively than respectively).

An 'amber' result was applied where the Mildura LGA result was within two percentage points of the Victorian result (in the case of a percentage). For example a Mildura LGA result of 27.5% in comparison to a Victorian result of 29.4% would be coded amber, had the Victorian result been 29.5% the traffic light would be either red or green.

For measures presented as rates an 'amber' results was applied where the rate was within 2% of the Victorian result. For example a Mildura LGA result of 27.5 (per 1,000) in comparison to a Victorian result of 47.4 (per 1,000) would be coded amber (2% of 1,000 is 20), had the Victorian result been 47.5 (per 1,000) the traffic light would be either red or green. Had the rate been per 10,000 the difference would need to have been 200 or greater, if the rate were per 100,000 the difference would need to have been 2,000 or greater.

Each measure also includes a Time Trend (if available) and offers the same data for our Victorian counterparts. Whilst some Time Trend data could be drawn from earlier reports much was filled retrospectively for this report. Time Trend data is identified with an arrow and colour code.

A red downwards arrow (↓) indicates the incidence of the measures is reducing for the worse (for example lessening rates of breastfeeding at birth). A red upwards arrow (↑) indicates the incidence of the measures is increasing for the worse (for example an increasing crime rate). By contrast a green downwards arrow (↓) indicates the incidence of the measures is reducing for the better (for example lessening rates of crime). A green upwards arrow (↑) indicates the incidence of the measures is increasing for the better (for example increasing rates of breastfeeding at birth). A sideways black arrow (→) indicates the trend has been stable between reporting periods – i.e. the rate has not changed. A black arrow pointing up or down (↓↑) indicates the direction of the trend is simply a fact, not better or worse (for example an increasing population aged 85 years and over).

If a measure was drawn from the earlier *2014 State of Mildura Rural City's Children and Young People Report* or the *2012 Social Indicators Report* they are indicated in the Measures Table as a ✓ and additional information on these measures can be drawn from these reports (both accessible from the Mildura Rural City Council website).

Lastly, some measures provided in *2014 State of Mildura Rural City's Children and Young People Report* and the *2012 Social Indicators Report* were no longer available in their exact earlier form. For this reason some measures were either retired or revised. In each instance they were replaced with a measure identified as a valid and enduring replacement. All changes are documented in the section of this report entitled 'Retired and Revised Measures'.

<b>Domain 4: Victorians are connected to culture and community</b> Outcome 4.2: Victorians can safely identify with their culture and identity	4.29 4.2.1.1 Proportion of adults who thought multiculturalism definitely made life in their area better, 2014, Victoria Population Health Survey DHHS (LGA)			38.4%	↑	55.4%
	4.30 Community acceptance of diverse cultures, 2011, VicHealth Indicators Survey (LGA) TL / R			35.4%		50.6%
	4.31 Community engagement Profile of group, Characteristics of New Arrivals (country, religion, language), 2016, ABS Census of Population and Housing (2017) (LGA) <i>(Table 5.2, 2012 Social Indicators Report)</i>	✓				
	4.32 Community engagement Education of New Arrivals, 2016, ABS Census of Population and Housing (2017) (LGA) <i>(Table 5.3, 2012 Social Indicators Report)</i>	✓				

<b>INDICATOR - Increase tolerance of diversity</b> <b>Our Social Environment</b> Social Inclusion and Diversity: Involve CALD and Indigenous Australians in the planning and development of community initiatives, Involve people living with special needs in community initiatives	4.33 New settler arrivals per 100,000 population, 2014/2015 Settlement Database, Department of Social Services, (LGA) TL / R			258.3	↓	682.5
	4.34 Humanitarian arrivals as a percentage of new settlers, 2014/2015 Settlement Database, Department of Social Services, (LGA) TL / R			42.3%	↑	9.3%
<b>Domain 5: Victoria is liveable</b> Outcome 5.1: Victorians belong to resilient and liveable communities <b>INDICATOR – Increase neighbourhood liveability</b>	5.1.1.1 Liveability (to be determined)					
	5.1 <b>Community engagement</b> Social cohesion, Volunteering, 2016 ABS Census of Population and Housing (LGA and SA1) TL <i>(Table 5.4: Volunteering, 2012 Social Indicators Report)</i>	✓		20.7%	↑	19.2%
	5.2 <b>Community engagement</b> Social cohesion, Unpaid assistance to a Person with a Disability, 2016 ABS Census of Population and Housing (LGA and SA1) TL <i>(Table 5.3: Unpaid Assistance, 2012 Social Indicators Report)</i> (results shown right are for 'Provided unpaid assistance')	✓		12.2%	↓	11.6%
<b>Domain 5: Victoria is liveable</b> Outcome 5.2: Victorians have access to sustainable built and natural environments <b>INDICATOR – Increase environmental sustainability and quality</b>	5.3 Kilowatts of Solar installed (Community), 2015-2016 PowerCor (LGA)					
	5.4 Kilowatts of Solar installed (Council), 2016-2017 PowerCor (LGA)					
	5.5 <b>5.2.1.4</b> Proportion of the population with reticulated drinking water that complies with the <i>E. coli</i> water quality standard, 2015/2016, Annual report on drinking water quality in Victoria Department of Health and Human Services (water sampling locality)					
	5.6 Selected Enteric Diseases, 2017, Public Health Event Surveillance System (PHESS) Department of Health and Human Services (LGA) - Annual Totals (and rate per 100,000), Salmonellosis infection, 2017, Surveillance of notifiable conditions in Victoria (results shown right are for Salmonellosis) - Annual Totals (and rate per 100,000), Campylobacter infection, 2017, Surveillance of notifiable conditions in Victoria			54.0	↓	66.3

Our Natural Environment Water: Create a resource efficient community through actions that improve reliable, sustainable and quality sources of water	- Annual Totals (and rate per 100,000), Cryptosporidiosis, 2017, Surveillance of notifiable conditions in Victoria - Annual Totals (and rate per 100,000), Listeriosis, 2017, Surveillance of notifiable conditions in Victoria					
	5.7 Vector Borne Diseases, 2017, Public Health Event Surveillance System (PHESS) Department of Health and Human Services (LGA) - Annual Totals (and rate per 100,000#), Barmah Forest virus infection, 2017, Surveillance* of notifiable conditions in Victoria - Annual Totals (and rate per 100,000#), Chikungunya virus infection, 2017, Surveillance* of notifiable conditions in Victoria - Annual Totals (and rate per 100,000#), Dengue virus infection, 2017, Surveillance* of notifiable conditions in Victoria (results shown right are for Dengue virus) - Annual Totals (and rate per 100,000#), Ross River virus infection, 2017, Surveillance* of notifiable conditions in Victoria			3.9	↑	4.2
	5.8 Environmental indicators Waste management Community water usage, 2015/2016, Lower Murray Water (LGA, Mildura, Red Cliffs, Robinvale) (Section 10.2 2012 Social Indicators Report)	✓			↑	
	5.9 Household Water Conservation rates (from 2011 VicHealth Indicators Survey), Community Indicators Victoria, 2011 (LGA) TL			49.0%		41.3%
	5.10 Environmental indicators Community energy usage, 'Energy Use (Mwh) per Economic Activity (GVA)' and 'Domestic Energy Use (Mwh) per Capita', 2011/12 – 2016/17, Powercor Australia Ltd (2017) (unpublished) (LGA) (Section 10.2 2012 Social Indicators Report)	✓				
	RETIRED Environmental indicators Vegetation cover	✓				
	5.11 Environmental indicators Land management practices, Irrigation Methods for permanent plantings (by Area, ha), 2015, SunRISE (2016) (LGA) (Table 10.8 2012 Social Indicators Report) REVISED FROM Prominence of Irrigation Methods (by Area, ha)	✓				
	RETIRED Environmental indicators Land management practices, Area of Agricultural Land with Environmental Management Plans, Mildura Rural City Council					
	5.12 Household Waste Recycling rates (from Sustainability Victoria – conducted annually), Community Indicators Victoria, 2011 (LGA)			22.4%		45.0%
	5.13 Kerbside collection waste diverted from landfill, 2015/2016, Department of Environment, Land, Water and Planning (LGA) TL			32.99%	↓	42.92%
Service Accessibility and Utilisation	S.1 Utilisation of selected health services per 1,000 population, 2014-15, Department of Health (LGA) TL / R (rates shown right for Registered mental health clients per 1,000 population)			24.0	↓	11.9

Outcome: Mildura LGA residents can access the services they require at the scale and time required Indicator: services are accessible	S.2 Percentage who believe there are good facilities and services in the LGA, 2008, Victorian Population Health Survey (LGA) TL / R			83.6%		85.2%
	S.3 Estimated number of people aged 18 years and over who experienced a barrier to accessing healthcare when needed it in the last 12 months, with main reason being cost of service (modelled estimates), 2014, Public Health Information Development Unit (2017) (LGA) TL			2.3		1.6
	S.4 Percentage of GP attendances(a) bulk-billed(b), 2014/15, by Statistical Area Level 3 (SA3) TL (results shown far right are for Australia)			90.0%	↓	84.3%
	S.5 Persons aged 18 years and over who delayed purchasing prescribed medication because they could not afford it (ASR per 100), 2010, Public Health Information Development Unit (2016) (LGA) TL			13.7		11.1
	S.6 Persons aged 18 years and over who had difficulty accessing services (ASR per 100), 2010, Public Health Information Development Unit (2016) (LGA) TL			37.9		27.9

## Retired Measures

RETIRED Measures		
Measures	Source	Rationale
1.1.1.1 Death rate of children under five years	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level
Happy and Healthy Children have a healthy childhood, Child Mortality (under 5 years), average annual rate per 100,000	State of Mildura Rural City's Children and Young People (2014)	This measure was replaced with two, more refined measures: Infant Deaths (all deaths under 12 months of age per 1,000 live births), and Child Mortality (1 to 4 years), average annual rate per 100,000
1.1.2.3.B Rate ratio of premature death between Aboriginal and non-Aboriginal Victorians not available at required level	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level
1.1.5.1.B Death rate due to road traffic crashes, Number of deaths of residents, where the cause was recorded as (relevant) ICD-10 code	Victorian public health & wellbeing outcomes framework (2016)	Measure fulfilled through existing measures
1.1.5.3 Death rate for injury in children and young people 0–25 years, Causes of Death ABS	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level.
Health Occupational accidents, Rate of Non-Farm Accidents between 2006-2011 (Per 1,000 Persons in the Non-Farm Labour Force),	MRCC Social Indicators Report (2012)	<p>Concerns were raised regarding the methodology applied to this measure in the 2012 Social Indicators Report. The measure, which presented 'all accidents not occurring on a farm' (numerator) by 'non-farm labour force' (denominator), assumed (incorrectly) 'all accidents' occurred in an occupational setting. This measure was retired and replaced with the following, more refined, measures:</p> <ul style="list-style-type: none"> <li>▪ Hospitalisations<sup>#</sup> for injuries that occurred while working for income (rate per 100,000), 2011/12 to 2013/14, Victorian Injury Surveillance Unit (VISU) (LGA)</li> <li>▪ Hospitalisations<sup>#</sup> for injuries that occurred while working for income - by sex, 2011/12 to 2013/14, Victorian Injury Surveillance Unit (VISU) (LGA)</li> <li>▪ Workplace injury claims - by industry sector, 2008 – 2014, WorkSafe Victoria (LGA)</li> <li>▪ Workplace fatalities by sex, 1997 to 2015, WorkSafe Victoria (LGA)</li> </ul>

		<ul style="list-style-type: none"> <li>Workplace fatalities by age group, 1997 to 2015, WorkSafe Victoria (LGA)</li> <li>Workplace fatalities by industry, 1997 to 2015, WorkSafe Victoria (LGA)</li> <li>Workplace fatalities by cause, 1997 to 2015, WorkSafe Victoria (LGA)</li> </ul>
Health Occupational accidents, Rate of Farm Accidents (Per 1,000 Persons in the Farm Labour Force)	MRCC Social Indicators Report (2012)	<p>Concerns were raised regarding the methodology applied to this measure in the 2012 Social Indicators Report. The measure assumed all accidents, to all ages, occurring on a farm were occupation related accidents and, as such, used 'farm labour force' as the denominator. This methodology failed to recognise that some accidents were not related to farming at all, for example a young child hurting themselves playing at their home on a farm. This measure was retired and replaced with the following, more refined, measures:</p> <ul style="list-style-type: none"> <li>Hospitalisations<sup>#</sup> for injuries that occurred on a farm (rate per 100,000), 2011/12 to 2013/14, Victorian Injury Surveillance Unit (LGA)</li> <li>Hospitalisations<sup>#</sup> for injuries that occurred on a farm - by sex, 2011/12 to 2013/14, Victorian Injury Surveillance Unit (LGA), and also by</li> <li>Workplace injury claims - by industry sector, 2008 – 2014, WorkSafe Victoria (LGA) (listed above)</li> </ul>
1.1.7.2 Proportion of people testing positive for chlamydia, Australian Collaboration for Coordinated Enhanced Sentinel Surveillance of Sexually Transmitted Infections and Blood Borne Viruses (ACCESS) (NNDSS)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level. Local data accessed from alternative sources are presented in the report
1.1.7.3 Notification rate for gonorrhoea, Public Health Event Surveillance System (PHESS) DHHS (Regions)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level. Local data accessed from alternative sources are presented in the report
1.1.7.5 Notification rate of newly acquired hepatitis C, Public Health Event Surveillance System DHHS (Regions)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level. Local data accessed from alternative sources are presented in the report
1.2.1.2 Proportion of adolescents 10–17 years with a high level of resilience, About You DET (Regions)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level through the VCAMS Portal. Alternative measures presented in the report
1.2.2.1 Suicide rate, Number of deaths of residents, where the underlying cause was recorded as ICD–10 codes X60–X84, Y87.0, Causes of Death ABS, (Regions)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level.

<b>Happy and Healthy</b> Children have a healthy childhood, Achieves usual daily intake of two or more serves of fruit (modelled estimate, rate per 100), persons aged 5 to 17 years	State of Mildura Rural City's Children and Young People (2014)	This measure was removed and replaced with more current and replicable measures captured through the Victorian Population Health Survey
<b>1.3.1.3.B</b> Proportion of adolescents 10–17 years who consume sugar sweetened beverages daily, About You DET (Regions)	Victorian public health & wellbeing outcomes framework (2016)	Not available through VCAMS Portal
<b>1.3.1.3.C</b> Proportion of children 5–12 years who consume sugar sweetened beverages daily, VCHWS DET (Regions)	Victorian public health & wellbeing outcomes framework (2016)	Not available through VCAMS Portal
<b>Happy and Healthy</b> Children have a physically active childhood, Physical inactivity (modelled estimate, rate per 100), persons aged 15 years and over	State of Mildura Rural City's Children and Young People (2014)	This measure was removed and replaced with more current and replicable measures: <ul style="list-style-type: none"> <li>Proportion of young people who do the recommended amount of physical activity every day, 2014, About You DET (Mallee Region only), and</li> <li>Proportion of children who do the recommended amount of physical activity every day, 2013, VCHWS DET (Mallee Region only)</li> </ul>
<b>1.3.2.1.A</b> Proportion of adults who are overweight or obese (measured), National Health Survey NHS ABS (ARIA)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level. Local data accessed from alternative source and presented in the report
<b>1.3.2.1.C</b> Proportion of adults who are obese (measured) National Health Survey NHS ABS (ARIA)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level. Local data accessed from alternative source and presented in the report
<b>Happy and Healthy</b> Children have a healthy childhood, Obese persons (modelled estimate, rate per 100), persons 18 years and over	State of Mildura Rural City's Children and Young People (2014)	This measure was removed and replaced with: <ul style="list-style-type: none"> <li>Proportion of children at school entry reported to be overweight, 2014, School Entrant Health Questionnaire</li> </ul>
<b>1.3.2.1.E</b> Proportion of children 5–17 years who are overweight or obese (measured) National Health Survey NHS ABS (ARIA)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level. Local data accessed from alternative source and presented in the report
<b>1.3.2.1.F</b> Proportion of children 5–17 years who are obese (measured) National Health Survey NHS ABS (ARIA)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level. Local data accessed from alternative source and presented in the report
<b>1.3.3.2</b> Age of smoking initiation National Drug Strategy Household Survey NDSHS AIHW (ARIA)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level.

<b>1.3.4.2</b> Proportion of people 14 years and older using an illicit drug in the past 12 months, NDSHS AIHW (ARIA)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level. Local data accessed from alternative source and presented in the report
<b>1.3.5.3</b> HPV three-dose vaccination coverage for adolescents turning 15 years of age	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level
<b>2.1.3.1</b> Proportion of adults experiencing at least one incident of sexual violence since the age of 15 years, Personal Safety Survey ABS (ARIA)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level
<b>2.1.3.4</b> Proportion of adults experiencing at least one incident of crime in the past 12 months, General Social Survey (GSS) ABS, (custom)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level. Local data accessed from alternative source and presented in the report
<b>2.1.3.5</b> Rate of victimisation due to crimes recorded by police, LEAP Victoria Police (PSA and LGA)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level
<b>Developing Well</b> Children are developing well by age six (AEDC), Children in Mildura LGA are well developed by their first year of school, 2015, Australian Early Development Census	State of Mildura Rural City's Children and Young People (2014)	Data not presented in the 2015 AEDC Mildura report
<b>Education</b> Playgroup participation, Number of Children Attending Mildura RCC Playgroups	MRCC Social Indicators Report (2012)	This measure was removed and replaced with the actual number of playgroups operating across the Mildura LGA
<b>Education</b> Attendance at pre-school, Proportion of Pre-School Attendance	MRCC Social Indicators Report (2012)	This measure was removed based on concerns about its methodology (i.e. proportion of pre-school attendance was based on denominator of all 0-4 year olds). The development of the Central Enrolment system will, in time, provide more accurate data a measure of pre-school attendance
<b>Engaged, Learning, Achieving</b> Children are participating in kindergarten, Services providing Universal Access to Early Childhood Education	State of Mildura Rural City's Children and Young People (2014)	No longer required
<b>Engaged, Learning, Achieving</b> Young people are engaged in learning or earning, Year 10–12 apparent retention rate	State of Mildura Rural City's Children and Young People (2014)	This measure was retired as VCAMS now only provides this data by region (North Western Victoria)
<b>Happy and Healthy</b> Children have a healthy childhood, Access to Food, 2008	State of Mildura Rural City's Children and Young People (2014)	This measure was removed and replaced with <ul style="list-style-type: none"> <li>Proportion of children 0–12 years living in households that ran out of food and could not afford to buy more, 2013, VCHWS DET (Mallee Region)</li> </ul>

4.1.1.3 Proportion of adults connected to culture and country (to be determined)	Victorian public health & wellbeing outcomes framework (2016)	Measure not yet determined at the Victorian level
Active Citizens Children and young people are civically engaged, Do you regularly volunteer your time to help out anywhere? Responding Yes, (LGA)	State of Mildura Rural City's Children and Young People (2014)	This measure was removed and replaced with 'Proportion of adults who volunteer (Yes, definitely)' Victorian Population Health Survey, DHHS (LGA) as a more regular and reliable indicator
4.1.2.1 Proportion of adults who have someone outside their household they can rely on to care for them or their children in an emergency, 2014, Victorian Population Health Survey AND Happy and Healthy Children, young people & families are supported by positive relationships, Can you get help from family, friends or neighbours when you need it? Responding Yes	Victorian public health & wellbeing outcomes framework (2016)  State of Mildura Rural City's Children and Young People (2014)	These measures were replaced with the following, more detailed measures, from the Victorian Population Health Survey: <ul style="list-style-type: none"> <li>- Proportion of adults, by ability to get help from family</li> <li>- Proportion of adults, by ability to get help from friends</li> <li>- Proportion of adults, by ability to get help from neighbours</li> </ul>
4.1.2.2.B Average extent that adults report that their life is worthwhile, Victorian Population Health Survey DHHS (LGA)	Victorian public health & wellbeing outcomes framework (2016)	Not reported in the 2014 Victorian Population Health Survey report
Gambling participation, 2003 Victorian Longitudinal Community Attitudes Survey		This measure was removed as it was considered outdated (2003) with no more recent data available
5.1.1.1 Liveability (to be determined)	Victorian public health & wellbeing outcomes framework (2016)	Measure not yet determined at the Victorian level
5.1.2.1 Excess death during extreme heat and heatwaves, Causes of Death ABS (regions)	Victorian public health & wellbeing outcomes framework (2016)	Measure not available at the Mildura LGA level
5.2.1.1 Renewable energy generation as a proportion of total electricity generation, Australian Energy Statistics, Department of Industry and Science (State)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level. This measure was replaced with the following: <ul style="list-style-type: none"> <li>- Kilowatts of Solar installed (Community), 2015-2016 PowerCor (LGA)</li> <li>- Kilowatts of Solar installed (Council), 2016-2017 PowerCor (LGA)</li> </ul>
5.2.1.2 Per capita greenhouse gas emission, National Greenhouse Gas Inventory, Department of the Environment and Energy (State)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level. No equivalent local data was identified
5.2.1.3 Number of days where the national objective of PM <sub>10</sub> was not met, Air monitoring network Environment Protection Authority (EPA) (data available for Melbourne, Latrobe valley and one location in Geelong only)	Victorian public health & wellbeing outcomes framework (2016)	Data not available at LGA level. No equivalent local data was identified

Environmental indicators Vegetation cover	MRCC Social Indicators Report (2012)	This measure was removed from the Mildura Rural City Council Plan as it was identified as being too difficult to measure accurately. For the same reason it was removed from this report
Environmental indicators Land management practices, Area of Agricultural Land with Environmental Management Plans	MRCC Social Indicators Report (2012)	This measure was removed based on agreement that this data was not captured by Mildura Rural City Council. The 2012 Social Indicators Report figure was considered inaccurate

## Revised Measures

REVISED Measures		
Measure	Source	Rationale
<p><b>Economic</b> Internet access and connections (SA1)  <i>(Table 7.11 2012 Social Indicators Report)</i></p> <p>REVISED MEASURE: Dwelling Internet Connection (LGA &amp; SA1s)</p>	MRCC Social Indicators Report (2012)	<p>Census coding for this measure has changed between the 2011 and 2016 Census of Population and Housing periods from 'internet types' to 'internet accessed from dwelling / internet not accessed from dwelling'</p> <p>Where Dwelling Internet Connection records whether any member of the household accesses the internet from the dwelling. This includes accessing the internet through a desktop/laptop computer, mobile or smart phone, tablet, music or video player, gaming console, smart TV or any other devices. It also includes accessing through any type of connection for example ADSL, fibre, cable, wireless, satellite and mobile broadband (3G/4G).</p>
<p><b>Health</b> Childhood accidents, Rate of Childhood Accidents (per 1,000 Children) (by postcode)            And  <b>Happy and Healthy</b> Children have a healthy childhood, Rate of Childhood Accidents (per 1,000 children), 2011</p> <p>REVISED MEASURE: Rate of Childhood Hospital Admissions (per 1,000 children aged 0-19 years) (LGA and SA2)</p>	MRCC Social Indicators Report (2012)	<p>This measure was difficult to replicate for two reasons.</p> <p>Firstly, the age cohort was not specified in the 2012 Social Indicators Report, and</p> <p>Secondly when current data was collated at postcode level (for the broadest possible age cohort, 0-19 years) the numbers were found to be too small to break down by year for some of the locations.</p> <p>As a result data was re-commissioned from Monash University to include clear age cohort (0-19 years) at the larger SA2 geographic level. Tables were developed retrospectively according to these parameters as far back as 2011 (when the ABS commenced presenting Mildura LGA data at the SA2 level).</p>
<p><b>Happy and Healthy</b> Children have a healthy childhood, Total Hospital Separations, per 1,000 children aged 0 to 8 years</p> <p>REVISED MEASURE: Children have a healthy childhood, Total Hospital Separations, per 10,000 children aged 0 to 9 years</p>	State of Mildura Rural City's Children and Young People (2014)	<p>This measure was adjusted slightly to encompass children aged 0-9 years (from children aged 0-8 years) to enable rate calculations from Census data. Rates were increased from per 1,000 to per 10,000.</p> <p>The 2005-2008 data reported in the <i>2014 State of Mildura Rural City's Children and Young People Report</i> was recalculated applying the revised methodology to enable the comparison of time trend data.</p>
<p><b>Happy and Healthy</b> Children have a healthy childhood, Total Hospital Separations Indigenous Children, per 1,000 children aged 0 to 8 years</p>	State of Mildura Rural City's Children and Young People (2014)	<p>This measure was adjusted slightly to encompass children aged 0-9 years (from children aged 0-8 years) to enable rate calculations from Census data. Rates were increased from per 1,000 to per 10,000.</p>

REVISED MEASURE: Children have a healthy childhood, Total Hospital Separations Indigenous Children, per 10,000 children aged 0 to 9 years		The 2005-2008 data reported in the <i>2014 State of Mildura Rural City's Children and Young People Report</i> was recalculated applying the revised methodology to enable the comparison of time trend data.
<p><b>Happy and Healthy</b> Children have a healthy childhood, Total Hospital Separations, per 1,000 children aged 0 to 8 years – Chapter XXI Factors (i.e. factors influencing health status)</p> <p>REVISED MEASURE: Children have a healthy childhood, Total Hospital Separations, per 10,000 children aged 0 to 9 years - Chapter XXI Factors (i.e. factors influencing health status)</p>	State of Mildura Rural City's Children and Young People (2014)	<p>This measure was adjusted slightly to encompass children aged 0-9 years (from children aged 0-8 years) to enable rate calculations from Census data. Rates were increased from per 1,000 to per 10,000.</p> <p>The 2005-2008 data reported in the <i>2014 State of Mildura Rural City's Children and Young People Report</i> was recalculated applying the revised methodology to enable the comparison of time trend data.</p>
<p><b>Happy and Healthy</b> Children have a healthy childhood, Total Hospital Separations Indigenous Children, per 1,000 children aged 0 to 8 years – Chapter XXI Factors (i.e. factors influencing health status)</p> <p>REVISED MEASURE: Children have a healthy childhood, Total Hospital Separations Indigenous children, per 10,000 children aged 0 to 9 years - Chapter XXI Factors (i.e. factors influencing health status)</p>	State of Mildura Rural City's Children and Young People (2014)	<p>This measure was adjusted slightly to encompass children aged 0-9 years (from children aged 0-8 years) to enable rate calculations from Census data. Rates were increased from per 1,000 to per 10,000.</p> <p>The 2005-2008 data reported in the <i>2014 State of Mildura Rural City's Children and Young People Report</i> was recalculated applying the revised methodology to enable the comparison of time trend data.</p>
<p><b>Happy and Healthy</b> Adolescents have good mental health, 'Psychiatric hospitalisations' for 10–17 year olds per 1,000 adolescents</p> <p>REVISED MEASURE: Adolescents have good mental health, Rate of Hospital Admissions for Mental and Behavioural Disorders, Residents aged 10-19 Years (per 10,000)</p>	State of Mildura Rural City's Children and Young People (2014)	<p>Both lack of clear definition regarding 'psychiatric hospitalisations / admissions' and overlap regarding age cohorts for these 3 measures necessitated this revision.</p> <p>Moving forwards these measures will reflect the HOSdata category 'Hospital Admissions for Mental and Behavioural Disorders' for the following age cohorts:</p> <ul style="list-style-type: none"> <li>- Residents aged 10-19 years</li> <li>- Residents aged under 20 years</li> <li>- Residents aged 20 years and over</li> </ul> <p>To provide comparable baseline data tables have been filled retrospectively for the 2005-08 and 2013-16 reporting periods.</p>
<p><b>Health</b> Rate of Child and Adolescent Psychiatric Admissions (per 1,000 Residents Aged Under 19 Residents)</p> <p>REVISED MEASURE: Rate of Hospital Admissions for Mental and Behavioural Disorders, Residents aged under 19 Years (per 10,000)</p>	MRCC Social Indicators Report (2012)	
<b>Health</b> Rate of Adult Psychiatric Admissions between 2006 and 2012 (Per 1,000 Adult Residents)	MRCC Social Indicators Report (2012)	

REVISED MEASURE: Rate of Hospital Admissions for Mental and Behavioural Disorders, Residents aged ≥20 Years		
<p><b>Safe and Secure</b> Children and young people are safe in their own homes, Percentage of family violence incidents where children and young people aged 0–17 years are present</p> <p>REVISED MEASURE: Percentage of family violence incidents where children and young people aged 0–17 years are <b>involved as other parties</b>,</p>	State of Mildura Rural City's Children and Young People (2014)	This measure is revised to reflect current VCAMS portal terminology.
<p><b>Community safety</b> Crime against property</p> <p><b>Community safety</b> Crime against person</p>	MRCC Social Indicators Report (2012)	Due to the change in data source between the State of Mildura Rural City Report (Crime Statistics Agency) and the 2012 Social Indicators Report (Victoria Police) the report findings cannot be compared for the Crime against Property and Crime against Person measures. As a result the 2012/2013 data in the State of Mildura Rural City Report was also analysed to provide offence rates and enable time trend comparisons.
<p><b>Health</b> Disability/sickness payment, Centrelink (postcode)</p> <p>REVISED MEASURE: Disability/sickness payment, Distribution of Disability Pensions and Sickness Allowances Rates (Per 1,000 residents), Centrelink (LGA and SA2)</p>	MRCC Social Indicators Report (2012)	Changes to DSS data reporting meant postcode level data was no longer available for this measure (post June 2014). It was agreed to commence reporting this measure at the SA2 level. Maps indicating postcode alignment to SA2s (page??) will support the reader in comparing earlier Social Indicator reports to the measure as it is reported in the 2018 State of Mildura Rural City Report. Tables could not be retro filled because earlier data was unavailable at the required geographical level.
<p><b>Engaged, Learning, Achieving</b> Young people are engaged in learning or earning, Young people aged 15 to 24 receiving an unemployment benefit</p> <p>REVISED MEASURE: Young people aged 16 to 24 receiving an unemployment benefit</p>	State of Mildura Rural City's Children and Young People (2014)	Revised to reflect changed reporting age cohort from 15-24 years to 16-24 years.
<p><b>Economic</b> Recipients of Newstart Allowance, Centrelink (postcode)</p> <p>REVISED MEASURE: Recipients of Newstart Allowance, Centrelink (SA2)</p>	MRCC Social Indicators Report (2012)	Changes to DSS data reporting meant postcode level data was no longer available for this measure (post June 2014). It was agreed to commence reporting this measure at the SA2 level. Maps indicating postcode alignment to SA2s (page??) will support the reader in comparing earlier Social Indicator reports to the measure as it is reported in the 2018 State of Mildura Rural City Report. Tables could not be retro filled because earlier data was unavailable at the required geographical level.

<b>Economic</b> Tourism, Domestic Overnight Visitors ('000), Tourism Research Australia (SA2) REVISED to LGA	MRCC Social Indicators Report (2012)	These measures, previously reported at the SA2 level, have been adjusted to be reported at the LGA level only as raw data at the SA2 level (for some Mildura LGA SA2s) was below the minimum sample size of 40 (not statistically correct), and not approved for publication by Tourism Research Australia. This revised measure could not be retro-filled for earlier Social Indicators Reports as LGA profiles were not compiled and published prior to 2012 (pers. comm. Tourism Research Australia).
<b>Economic</b> Tourism, Domestic Day Visitors ('000), Tourism Research Australia (SA2) REVISED to LGA	MRCC Social Indicators Report (2012)	
<b>Economic</b> Tourism, International Visitors (No.), Tourism Research Australia (SA2) REVISED to LGA	MRCC Social Indicators Report (2012)	
<b>Social distress</b> Home purchase stress, ABS Census (LGA and SA1)  REVISED MEASURE: Households where mortgage payments are 30%, or greater, of household income (LGA and SA2)	MRCC Social Indicators Report (2012)	<p>The 2012 <i>Social Indicators Report</i> measures of 'Home Purchase Stress' and 'Rental Stress' were revised to:</p> <ul style="list-style-type: none"> <li>- Be reported at the SA2 level (as opposed to the previous SA1 Grouping) and,</li> <li>- Report the ABS established measure of 'Households where mortgage payments are 30%, or greater, of household income' and 'Households where rent payments are 30%, or greater, of household income' respectively (rather than the low, medium and high income bands methodology utilised in 2012).</li> </ul> <p>Tables were filled retrospectively from the 2011 Census of Population and Housing to provide comparable time trend data.</p>
<b>Social distress</b> Rental stress, ABS Census (LGA and SA1)  REVISED MEASURE: Households where rent payments are 30%, or greater, of household income (LGA and SA2)	MRCC Social Indicators Report (2012)	
<b>Cultural indicators</b> Art gallery, Mildura Rural City Council (postcode)	MRCC Social Indicators Report (2012)	The presentation of this measure was revised to reflect the manner by which postcode data is collected and grouped by the Mildura Arts Centre. The key change is that Ouyen is not grouped with Mildura, it is instead grouped with 'Red Cliffs and Surrounds'
<b>5.2.1.5</b> Notification rate of salmonellosis, Public Health Event Surveillance System (PHESS) DHHS (LGA)	Victorian public health & wellbeing outcomes framework (2016)	REPLACE WITH Enteric Diseases, 2016, Public Health Event Surveillance System (PHESS) DHHS (LGA)
<b>Environmental indicators</b> Land management practices, Prominence of Irrigation Methods (by Area, ha)  REVISED MEASURE: Irrigation Methods for permanent plantings (by Area, ha)	MRCC Social Indicators Report (2012)	<p>This measure was replaced by 'Irrigation Methods for permanent plantings (by Area, ha)', 2015, SunRISE (2016) (LGA).</p> <p>Discussion with report author Sue Argus, SunRISE revealed data presented in the 2012 Social Indicators report was provided at the Victorian Murray-Mallee Region not the Mildura LGA.</p> <p>Data for this measure for the Mildura LGA is presented in this report for 1997, 2003, 2006, 2009, 2012 and 2015 to provide revised baseline data to replace inaccurate reporting in earlier Social Indicators reports</p>

# Population Overview

## O.1 Mildura At a Glance, 2016, ABS Census of Population and Housing (2017), (LGA and SA2)

The table below, draw from the 2016 and 2011 ABS Census of Population and Housing provides an 'at a glance' look at the key characteristics of the Mildura LGA and the six SA2s set against Regional Victoria and the State of Victoria. Arrows beside each figure indicate where there has been an increase (↑) or decrease (↓) since the 2011 Census (2011 Census data is shown in italics). The overwhelming trend was for:

- Increases in total population (with the exception Mildura Region SA2)
- Increases in median age
- Increases in the proportion of the population identifying as Indigenous (with the exception of Mildura South SA2, Merbein SA2 and Wentworth-Buronga SA2)
- Decreases in the proportion of the population born in Australia
- Increases in median weekly household incomes and
- Decreases in the proportion of households receiving less than \$650 gross weekly income.

### Selected Person Characteristics, Medians and Averages, 2016

Area	Population	Male / female	Median Age (yrs)	Indigenous	Born in Australia	Median weekly household income	Less than \$650 gross weekly income (% of households) *less than \$600 in 2011

## O.2 Overview Age Distribution Across Mildura, ABS Census, 2016, General Community Profiles (2017) (LGA and SA1) *(Table 2.1, 2012 Social Indicators Report)*

Analysis of 2016 ABS Census data on age distribution reveals some interesting patterns and consistent trends. Drawing on the age distribution table from the *2012 Social Indicators Report* (table 2.1) indicates:

- Communities such as Nichols Point and Koorlong / Cardross continue to exhibit higher proportions of population in the 0-19 years age cohorts
- Communities such as Ouyen / Walpeup and the Mallee Track continue to exhibit higher proportions of population in the 45-56+ years age cohorts, with particular growth in the 65+ years age cohort for Ouyen / Walpeup (from 22.7% in 2011 to 27.6% in 2016).
- Interestingly Nangiloc / Colignan now have a proportionally higher young to middle-aged adult population, the highest of all other SA1 groupings (with the exception of the 25-44 years age cohort in Mildura North).
- Trend arrows are included for the Mildura LGA, showing increase / decrease in proportion of population for the 0-4, 45-64 and 65+ age cohorts.

### Age Distribution across Mildura, 2016

SA1 Grouping*	0-4 (#) %	5-9 (#) %	10-14 (#) %	15-19 (#) %	20-24 (#) %	25-44 (#) %	45-64 (#) %	65+ (#) %	Total	Average Age **

### O.3 Population forecast by 5 year age cohorts, (2011 – 2031), Victoria in Future (2016) (LGA)

#### Population forecast by 5 year age cohorts, Mildura LGA (2011 – 2031)

Comparison of the 2011 age cohort actual population to the projected age cohort population in 2031 shows all age cohorts experiencing growth with the exception of persons aged 10-14, 15-19, 40-44, 45-49 and 50-54 years (shown in red in the table below). The highest proportional growth is in the older age cohorts (persons aged 75+ years) and notably for those aged 85 years and over.

	Persons 0-4	Persons 5-9	Persons 10-14	Persons 15-19	Persons 20-24	Persons 25-29	Persons 30-34	Persons 35-39	Persons 40-44	Persons 45-49	Persons 50-54	Persons 55-59	Persons 60-64	Persons 65-69	Persons 70-74	Persons 75-79	Persons 80-84	Persons 85 and over

#### O.4 **Overview** Gender Distribution Across Mildura, 2016, General Community Profiles (2017) (LGA and SA1s) *(Table 2.2, 2012 Social Indicators Report)*

##### Gender Distribution Across Mildura, 2016

SA1 Grouping*	Male (#) %	Female (#) %	Total
Merbein	(2,388) <b>50.1%</b>	(2,384) 49.9%	4,773
Mildura North	(8,789) 48.7%	(9,278) <b>51.4%</b>	18,065
Mildura South	(6,891) 47.4%	(7,659) <b>52.6%</b>	14,552
Nichols Point	(242) <b>50.1%</b>	(243) 50.3%	483**
Irymple	(3,040) <b>50.9%</b>	(2,936) 49.2%	5,972
Koorlong / Cardross (Greater)	(670) <b>54.3%</b>	(572) 46.4%	1,234
Red Cliffs	(2,514) 49.7%	(2,551) 50.4%	5,060
Millewa	(227) <b>55.0%</b>	(188) 45.5%	413
Nangiloc / Colignan (Greater)	(386) <b>56.3%</b>	(295) 43.0%	686
Ouyen / Walpeup	(737) <b>50.8%</b>	(721) 49.7%	1,452
Mallee Track	(363) <b>51.7%</b>	(343) 48.9%	702
<b>Mildura LGA</b>	<b>(26,481) 49.1%</b>	<b>(27,398) 50.9%</b>	<b>53,878</b>
Robinvale	(1,822) 51.4%	(1,723) 48.6%	3,544
NSW towns	(3,513) 51.7%	(3,287) 48.4%	6,798
Regional Victoria ***	(704,128) 49.1%	(729,694) 50.9%	1,433,818
Melbourne ****	(2,199,597) 49.0%	(2,285,616) 51.0%	4,485,211

Between the 2011 and 2016 Census periods there was a slight proportional growth in the Mildura LGA male population from 49.0% in 2011 to 49.1% in 2016. Rural communities across the Mildura LGA continue to exhibit higher proportions of male population, notably Nangiloc / Colignan (56.3%, up from 54.4% in 2011), Millewa (55.0%, up from 54.5% in 2011) and Koorlong / Cardross (54.3%, up from 53.1% in 2011).

Across the Mildura LGA it was the most populated SA1 groupings of Mildura North and Mildura South that exhibited the highest proportions of female population (51.4% and 52.6% respectively). Collectively represented as Mildura in the 2011 Census these areas had a 52.5% female population.

Gender Distribution Across Mildura, 2016

O.5 **Overview** Residents Aged 80+ and 85+ Years of Age, ABS Census (2016), General Community Profiles (2017) (LGA) *(Table 2.3, 2012 Social Indicators Report)*

Comparing the 2011 and 2016 ABS Census data reveals an increase in both the 80+ years and 85+ years age cohorts for the Mildura LGA (14.6% and 27.3% respectively) which surpasses that witnessed at the Regional Victoria (12.6% and 22.2%) and Melbourne (13.4% and 21.7%) levels. Comparison of the 2011 and 2016 data for the Mildura LGA does however reveal a slowing of this growth for both age cohorts. For example, in 2011 the 80+ years age cohort had grown by 22.3% between 2006 and 2011. Over the same period the 85+ years age cohort had grown by 29.8%.

Residents Aged 80+ and 85+ Years of Age, 2016

Area	80+ years*			85+ years			Total population		
	2011	2016	Increase	2011	2016	Increase	2011	2016	Increase
	No.	No.	%	No.	No.	%	No.	No.	%

Melbourne***	152,046	172,370	13.4%	73,236	89,151	21.7%	3,999,982	4,485,211	12.1%

Source: ABS TableBuilder, <http://www.abs.gov.au/websitedbs/censushome.nsf/home/tablebuilder>

\* 80+ years includes all residents aged over 80 years (so includes those aged over 85+ years also)

\*\* Regional Victoria figures are calculated by deducting Melbourne figures from State of Victoria figures. Note Regional Victoria figures referenced in the 2012 Social Indicators Report are actually for all of Victoria and inaccurate. Increase between the 2011 and 2016 populations for Regional Victoria are based on accurate figures reported in this document

\*\*\* Melbourne refers to the Greater Capital City Statistical Area of Melbourne (GCCSA)

Methodology: (Present population) - (Past population) / (Past population) x 100 = population growth as a percentage.

O.6 **Overview** Comparison of Rate of Increase between 2011 and 2016 Censuses, ABS Census, 2016, General Community Profiles (2017) (LGA) *(Figure 2.2, 2012 Social Indicators Report)*

Comparison of Rate of Increase between 2011 and 2016 Censuses

Comparison of the rate of increase between the 2011 and 2016 Census periods Mildura LGA experienced a great increase in the 80+ years and the 85+ years cohorts than witnessed at the Regional Victoria and Melbourne levels.

O.7 **Overview** Indigenous Status by Age by Sex, 2016, ABS Census of Population and Housing Aboriginal and Torres Strait Islander Peoples Profile, (2017) (LGA and SA2)

Indigenous Status data for the Mildura LGA drawn from the 2016 ABC Census of Population and Housing is collated and analysed over the ensuing pages. Importantly data is analysed at both the LGA and SA2 levels and follows two methodologies. Indigenous Status data is reported, in order of presentation, as follows:

1. Proportion of Indigenous children within each age cohort, OF ALL INDIGENOUS RESIDENTS, for example the number of Indigenous children aged 0-4 years as a proportion of the entire Indigenous population.
2. Proportion of all children within each age cohort, OF ALL RESIDENTS, for example the number of children aged 0-4 years as a proportion of the entire population. Measures 1 and 2 are presented for the Mildura LGA only, reported proportions by 'Indigenous status cohort' and are shown side-by-side below.
3. Proportion of Indigenous children within an age cohort, OF ALL CHILDREN IN THAT AGE COHORT, for example the number of Indigenous children aged 0-4 years as a proportion of all children aged 0-4 years. Measure 3 is presented for the Mildura LGA and SA2s and show proportions by 'age cohort'.

The measures reported below reveal that the proportion of the Mildura LGA Indigenous population within the 0-4, 5-9, 10-14 and 15-19 years age cohorts was higher than that of their Victorian counterparts. By contrast the Mildura LGA Indigenous population aged 20-24 years cohort formed a lesser proportion of the entire Mildura LGA Indigenous population than their Victorian counterparts. In terms of trends over time the proportion of the Mildura LGA Indigenous population aged 0-4, 5-9 and 20-24 years declined between the 2011 and 2016 Census reporting periods. The proportion of the entire Mildura LGA Indigenous population aged 10-14 and 15-19 years remained unchanged between the 2011 and 2016 Census reporting periods.

Source: 2016 ABS Census of Population and Housing, Aboriginal and Torres Strait Islander Peoples Profile, Mildura LGA & Victoria STE <a href="http://www.abs.gov.au/websitedbs/D3310114.nsf/Home/2016%20Census%20Community%20Profiles">http://www.abs.gov.au/websitedbs/D3310114.nsf/Home/2016%20Census%20Community%20Profiles</a> Accessed 28/06/2017	

Tables below show analysis of this same population data to reveal the proportion of the total 'age cohort' population each 'Indigenous status' age cohort represents. For example Aboriginal and / or Torres Strait Islander persons aged 0-4 years is divided by Total persons aged 0-4 years to give the proportion of that age cohort identified as Aboriginal and / or Torres Strait Islander through the 2016 ABS Census of Population and Housing.

Trend data is shown through the arrow column with ↑ indicating an increase in the actual number of persons since the 2011 Census and ↓ indicating a decrease in actual number over the same period. The most consistent trend is the increase in 'Indigenous status not stated' suggesting that the change in data collection methods between the 2011 and 2016 Census may have decreased respondent willingness to complete all questions. A trend of decline in the Indigenous early years population (0-4 years) is replaced by increases in the Indigenous population from 2011 figures for all other reported age cohorts (i.e. 5-9 years, 10-14 years, 15-19 years and 20-24 years).

Proportions within age cohort reveal the Mildura LGA has higher proportions of both Aboriginal and / or Torres Strait Islander persons and higher proportions of Indigenous status not stated within each age cohort than for their Victorian counterparts. For example:

- 8.3% of the Mildura LGA population aged 0-4 years identifies as ATSI and 7.5% are recorded as Indigenous status not stated compared to 1.5% and 5.4% respectively across Victoria;
- 8.1% of the Mildura LGA population aged 5-9 years identifies as ATSI and 6.7% are recorded as Indigenous status not stated compared to 1.5% and 5.1% respectively across Victoria;
- 7.5% of the Mildura LGA population aged 10-14 years identifies as ATSI and 6.9% are recorded as Indigenous status not stated compared to 1.5% and 5.0% respectively across Victoria;
- 5.9% of the Mildura LGA population aged 15-19 years identifies as ATSI and 7.7% are recorded as Indigenous status not stated compared to 1.3% and 5.1% respectively across Victoria; and
- 5.6% of the Mildura LGA population aged 20-24 years identifies as ATSI and 8.2% are recorded as Indigenous status not stated compared to 1.0% and 5.9% respectively across Victoria.

Proportions methodology: Numerator – Indigenous status by age cohort / Denominator - total persons by age cohort

The following tables further analyse the proportion of the total 'age cohort' population each 'Indigenous status' age cohort represents by the refined geographical area of SA2. Of the six Mildura LGA SA2s the SA2 with both the highest proportion and real number Indigenous populations in the 0-4, 5-9, 10-14, 15-19 and 20-24 years age cohorts is Mildura North. Interestingly the Wentworth-Buronga SA2 has higher proportions (although lesser real numbers) for all listed age cohorts than the Mildura North SA2.

#### Indigenous Status by Age by Sex, Mildura North SA2, 2016

## O.8 **Overview** Level of Relative Socio-Economic Disadvantage, ABS Census (2016), Socio-Economic Indexes for Areas (SEIFA) (2016) (LGA) TL / R

The health and wellbeing of individuals and populations are influenced by, and determined as the result of, the interactions among human biology, lifestyle and environmental (including social) factors, modified by health and other interventions. Socioeconomic characteristics are key determinants of health and well-being, and contribute to differences in health or 'health inequality' across the population.

In fact the link between poor health and poverty is clear: those with the least resources suffer more from avoidable illness and reduced life expectancy, often across generations. These inequalities are particularly evident for Aboriginal Victorians.

Despite significant achievements in public health in Victoria over the past century, the evidence on socioeconomic status (SES) and health in Australia is unequivocal: people lower in the socioeconomic hierarchy fare significantly worse in terms of their health. Specifically, those classified as having low SES have higher mortality rates for most major causes of death. Their morbidity profile indicates they experience more ill health (both physiological and psychosocial), and their use of healthcare services suggests they are less likely, or may have less opportunity, to act to prevent disease or detect it at an early stage.

Socioeconomic status (SES) is typically measured by attributes that include educational attainment, occupational status and income. Greater levels of educational attainment are associated with higher levels of knowledge and other non-material resources likely to promote a healthy lifestyle. Education also provides formal qualifications that affect occupational status and associated income level. Occupational status reflects social status, power and material conditions related to paid work. Income provides individuals and families with necessary material resources (including housing and access to transport) and determines their purchasing power for accessing goods and services needed to maintain good health (DHHS, 2014, and DHHS, 2015).

Certain cohorts within the Mildura LGA are experiencing significant levels of socio-economic disadvantage in terms of income, education, occupation, wealth and living conditions. Based on the 2016 ABS *Census of Population and Housing* the Mildura LGA was allocated an Index of Relative Socio-Economic Disadvantage (IRSD) score of 935 compared to the Victorian average of 1,000 (where a lower score represents great levels of disadvantage). This 'score' sees the Mildura LGA ranked as the 5<sup>th</sup> most disadvantaged LGA of 79 LGAs in Victoria with a decile of 1 and a percentile of 7. These figures have remained constant between the 2011 and 2016 Census periods.

Level of Relative Socio-Economic Disadvantage (ranked amongst all 79 Victorian LGAs), 2016

## O.9 Overview Level of Relative Socio-Economic Advantage and Disadvantage, ABS Census (2011), Socio-Economic Indexes for Areas (SEIFA) (2011) (LGA) TL / R

Based on the 2016 ABS *Census of Population and Housing* the Mildura LGA was allocated an Index of Relative Socio-Economic Advantage and Disadvantage (IRSAD) score of 921 compared to the Victorian average of 1,000 (again where a lower score represents great levels of disadvantage). Applying the IRSAD 'score' the Mildura LGA ranked as the fifth most disadvantaged LGA in Victoria (a positive decrease from its rank as the third most disadvantaged LGA in 2011). The Mildura LGA remained in the highest 10% of disadvantaged LGAs (1<sup>st</sup> decile and with a percentile of 7).

Level of Relative Socio-Economic Advantage and Disadvantage (ranked amongst all 79 Victorian LGAs), 2016

### O.11a **Overview** SEHQ Disadvantage – Distribution of Children across IRSD SEIFA quintiles, by population groups, Victoria, 2014

The School Entrant Health Questionnaire is a parent report instrument that records parent's concerns and observations about their child's health and wellbeing as they begin primary school in Victoria.

The table below was developed by the Department of Education and Training and draws from Victorian level findings from the School Entrant Health Questionnaire (SEHQ) to reveal higher levels of disadvantage (or IRSD - Index of Relative Socio-economic Disadvantage) amongst certain population cohorts. Children overrepresented within the highest level of disadvantage (quintile 1) include Aboriginal or Torres Strait Islander children (42.5%), children with a Language background other than English (35.3%) and children living in Rural/Regional areas (31.8%).

Population group	IRSD quintile 1*	IRSD quintile 2	IRSD quintile 3	IRSD quintile 4	IRSD quintile 5
All Children	20.8%	18.3%	20.0%	19.2%	21.5%
Language background other than English	35.3%	16.7%	19.7%	12.9%	15.5%
Aboriginal or Torres Strait Islander	42.5%	27.0%	14.8%	10.1%	5.3%
One-parent family	31.3%	22.5%	19.7%	14.3%	12.1%
Boys	20.8%	18.5%	20.1%	19.5%	21.0%
Girls	21.2%	18.4%	20.1%	19.2%	21.0%
Rural/Regional areas	31.8%	29.7%	15.9%	17.9%	4.6%
Metropolitan areas	16.7%	14.1%	21.6%	19.7%	27.9%

\*with most disadvantaged being quintile 1 and the least disadvantage being quintile 5.

O.11b 1.1.2.3.A Rate ratio of premature death between socioeconomic disadvantage quintiles

Once again the following data is not Mildura LGA specific, rather it is included to demonstrate the health and well-being vulnerability that can accompany socio-economic disadvantage. This data is made meaningful through comparison of the most recent levels of disadvantage revealed across the Mildura LGA in 2016 SEIFA data.

			Premature deaths (aged under 75)			Potential years of life lost (PYLL)		Potentially avoidable deaths (PAD)		
		Median age at death (years)	Premature deaths	Premature deaths (% of total deaths)	Premature deaths age-standardised rate (per 100,000)	PYLL under 75 (person-years)	PYLL under 75 rate (per 1,000)	PAD	PAD (% of premature deaths)	PAD age-standardised rate (per 100,000)
Socioeconomic group - Quintile 1 (lowest)	2010	79.0	12,089	38.3	275.6	210,713	49.8	6,260	51.8	144.8

## O.12 Household Composition by Number of Persons Usually Resident, 2016, ABS Census General Community Profiles (2017) (LGA and SA2)

### Household Composition by Number of Persons Usually Resident(a), 2016

Across the Mildura LGA the 2016 Census revealed a higher proportion of sole occupant private dwellings (28.6%) compared to their Victorian counterparts (24.7%). Within the Mildura LGA the SA2 with the highest proportion of sole occupant private dwellings was Mildura North (32.9%) and the SA2 with the lowest proportion of sole occupant private dwellings was Irymple (20.5%).

By contrast in the Mildura LGA 3.1% of all private dwellings were households with '6 or more' residents compared to 3.2% of Victorian private dwellings. Within the Mildura LGA the SA2 with the highest proportion of private dwellings with '6 or more' residents was Irymple (4.1%) and the SA2 with the lowest proportion of private dwellings with '6 or more' residents was Mildura South (2.5%).

O.13 **Overview** Family Structures, Family Composition, 2016 ABS Census of Population and Housing (2017) (LGA and SA1) *(Table 2.6, 2012 Social Indicators Report)*

At the Mildura LGA level, between the 2011 and 2016 Census periods there was a slightly increasing proportion of 'couple families without children' (up from 40.1% in 2011 to 41.3% in 2016), a slightly decreasing proportion of 'couple families with children' (down from 40.4% in 2011 to 39.5% in 2016), a slightly decreasing proportion of 'one parent families' (down from 18.2% in 2011 to 17.9% in 2016) and a slightly increasing proportion of 'other families' (up from 1.2% in 2011 to 1.4% in 2016).

The highest proportion of 'couple families without children' changed from Koorlong / Cardross in 2011 (55.4%) to Nichols Point in 2016 (55.6%). The lowest proportion of 'one parent families' continued to be the Mallee Track (6.5% in 2011 and 4.5% in 2016), the highest proportion of 'one parent families' continued to be Mildura (21.2% in 2011), however the separation of the Mildura SA2 into two SA2s (Mildura North and Mildura South) provided greater detail, revealing that the highest proportion of 'one parent families' was in fact in Mildura North (23.7%), well above the Regional Victorian (16.2%), Melbourne (15.0%) and Victorian (15.3%) proportions.

#### O.14 **Overview** Percentage of one parent families (of Total Family Households), 2016, ABS Census of Population and Housing (2017) (LGA)

According to the 2016 Census of Population and Housing across the Mildura LGA 39.5% of families were couple families with children, 41.3% were couple families without children and 17.9% were one parent families compared to Victoria where 46.3% of families were couple families with children, 36.5% of families were couple families without children and 15.3% of families were one parent families. Of these one parent families in the Mildura LGA 18.5% were male led (compared to 17.8% across Victoria) and 81.5% were female led (compared to 82.2% across Victoria).

##### Percentage of one parent families (of Total Family Households), 2016

Mildura 17.9%

Victoria 15.3%

Time Trend – a decreasing proportion of all Mildura LGA families identified as one parent families between the 2011 and 2016 Census reporting periods ↓

##### Percentage of one parent families (of Total Family Households), 2011

Mildura 18.2%

Victoria 15.5%

#### O.15 **Overview** Percentage of Indigenous one parent families (of Total Indigenous Family Households), 2016, ABS Census General Community Profiles (2017) (LGA)

According to the 2016 Census of Population and Housing 47.1% of all Indigenous Family Households were one parent families compared to Victoria where 33.2% of all Indigenous Family Households were one parent families. For the Mildura LGA this was an increase from the 2011 Census when 46.8% of all Indigenous Family Households were one parent families.

##### Percentage of Indigenous one parent families (of Total Indigenous Family Households), 2016

Mildura 47.1%

Victoria 33.2%

Time Trend – an increasing proportion of all Mildura LGA Indigenous families identified as one parent families between the 2011 and 2016 Census reporting periods ↑

##### Percentage of Indigenous one parent families (of Total Indigenous Family Households), 2011

Mildura 46.8%

Victoria 35.4%

**O.16 Household Composition and Family Composition by Number of Persons Usually Resident by Indigenous Status of Household, 2016, ABS Census Aboriginal and Torres Strait Islander Peoples Profile (2017) (LGA)**

Household Composition and Family Composition by Number of Persons Usually Resident(a) by Indigenous Status of Household, Mildura LGA, 2016

Family Composition is further refined in the following table by detailing household composition (an indication of family size) and Indigenous status. Significantly analysis reveals that, across the Mildura LGA, 47.1% of all family households with Aboriginal and Torres Strait Islander residents are one parent family households compared to only 15.3% of all family 'other' households across the Mildura LGA being one parent family households (this is in contrast to the figure of 17.9% reported above for the percentage of one parent families *of Total Family Households*). At the Victorian level 33.2% of all family households with Aboriginal and Torres Strait Islander residents are one parent family households. By comparison only 14.3% of all family 'other' households across Victoria being one parent family households.

Interesting also is the larger size of one parent family households with Aboriginal and Torres Strait Islander residents. The table below identifies 18.7% of one parent family households with Aboriginal and Torres Strait Islander residents have five or more residents (presumably one parent with four or more children, although this could also include one parent with children and extended family members or friends) compared to only 5.8% of all 'other' one parent families.

#### O.18 Registered Marital Status by Age, 2016, ABS Census of Population and Housing, (2017) (LGA)

Notwithstanding the fact that the following table does not include de facto marriages it does reveal some interesting points of difference between the Mildura LGA and their Victorian counterparts. Differences include: a lesser proportion of the Mildura LGA identifying as 'married' (47.0%) compared to 48.4% of Victorians aged 15 years and over, and a higher proportion of Mildura LGA residents aged 15 years and over identifying as separated (3.7% compared to 3.0% at the state level), divorced (9.1% compared to 7.9% at the state level) and widowed (6.8% compared to 5.2% at the state level).

##### Registered Marital Status by Age (Count of persons aged 15 years and over), Mildura LGA, 2016

#### O.19 Social Marital Status\* by Age by Sex, 2016, ABS Census of Population and Housing, (2017) (LGA)

Social Marital Status data collected by the ABS includes same-sex couples in the figure counting 'married in a de facto marriage'. 2016 Census data reveals that 10.9% marriages, as understood through 'social marriage status', are de facto marriages compared to 9.9% at the Victorian level.

Social Marital Status by Age, Count of persons aged 15 years and over(a), Mildura LGA, 2016

Proportions Methodology: Numerator – social marital status (i.e. de facto) / Denominator – total.

This table is based on place of usual residence.

\* Social marital status is the relationship status of an individual in terms of whether she or he forms a couple relationship with another person living in the same usual residence, and the nature of that relationship. A marriage exists when two people live together as husband and wife, or partners, regardless of whether the marriage is formalised through registration. Individuals are, therefore, regarded as married if they are in a de facto marriage, or if they are living with the person to whom they are registered as married. <http://www.abs.gov.au/ausstats/abs@.nsf/Lookup/2901.0Chapter53302011>

(a) Excludes persons in 'Visitors only' and 'Other non-classifiable' households, 'Non-private dwellings', and 'Migratory, off-shore and shipping' SA1s. Excludes persons who were temporarily absent on Census Night.

(b) Includes same-sex couples.

NOTE: there are small random adjustments made to all cell values to protect the confidentiality of data. These adjustments may cause the sum of rows or columns to differ by small amounts from table totals.

O.20 **Overview** Same-Sex Couples, 2016, Census of Population and Housing (2017) (LGA) *(Table 2.7 2012 Social Indicators Report)*

Proportion of Couples who are Same-Sex Couples, 2016

In comparison to the 2011 Census data presented throughout the 2012 Social Indicators Report there has been a slight increase at all geographical levels in the proportion of all couples reporting as same-sex couples. For example, in the Mildura LGA the proportion of couples who are same-sex couples increased from 0.5% of all couples in 2011 to 0.6% of all couples in 2016, similarly for Victoria the proportion of couples who are same-sex couples increased from 0.7% of all couples in 2011 to 1.0% of all couples in 2016.

Area	Male same-sex couple	Female same-sex couple	Total same-sex couples (No.) %	Opposite-sex couple	All couples
<b>Mildura LGA</b>	<b>27</b>	<b>37</b>	<b>64</b> 0.6%	<b>11,046</b>	<b>11,110</b>
Regional Victoria*	790	1,153	(1,943) 0.6%	303,893	307,779
Melbourne**	5,799	4,914	(10,713) 1.1%	953,135	963,848
Victoria	6,587	6,071	(12,658) 1.0%	1,257,026	1,269,684

Source: ABS TableBuilder,

<http://www.abs.gov.au/websitedbs/censushome.nsf/home/tablebuilder>

Proportions Methodology: Numerator - total same-sex couples / Denominator – all couples

\* Regional Victoria refers to the 2016 Census classification of 'Rest of Victoria' – which is the remaining area within the State of Victoria which does not fall within the Melbourne Greater Capital City Statistical Area geography

\*\* Melbourne refers to the Greater Capital City Statistical Area of Melbourne (GCCSA)

O.21 **Overview** Backgrounds of Arrivals, Age, Income (note this is new arrivals from overseas and intra and inter-state), Census of Population and Housing, 2011. Cat. No. 2001.0. (LGA) (*Section 2.3, 2012 Social Indicators Report*)

Drawing on 2016 Census of Population and Housing data 18,173 new residents moved into the Mildura LGA between the 2011 and 2016 Census periods. This analysis draws on the Census question 'Usual Address Five Years Ago' where answers were either 'Elsewhere in Australia' or 'Overseas in 2011'. This is a significant increase from the figure of approximately 10,000 reported in the 2012 Social Indicators Report. Recalculation of the 2011 Census data based on the same methodology used for the 2016 Census data would suggest that there were 17,354 Mildura LGA residents either 'Elsewhere in Australia' or 'Overseas in 2006' (this is shown in the tables below). A figure more in keeping with the 2016 findings.

Usual Address Five Years Ago Indicator (UAI5P)	Mildura (LGA) 2011 Census of Population and Housing	Mildura (LGA) 2011 Census of Population and Housing
Same as 5 years ago	27,425	27,355
Elsewhere in Australia	16,356	16,872
Overseas 5 years ago	998	1,301
Total*	44,776	45,529

Source: ABS TableBuilder, <http://www.abs.gov.au/websitedbs/censushome.nsf/home/tablebuilder>

\*Persons aged under 5 years are not counted in these tables

Of these new arrivals occurring between the 2011 and 2016 Census periods 1,301 were Overseas in 2011 (or 7.2% of all new arrivals to the Mildura LGA) and 16,872 were from 'Elsewhere in Australia' (92.8%). For both the largest number of new arrivals were in the 5-45 years age cohorts (with 11,477 of all 'Elsewhere in Australia' new arrivals aged 5-45 years, or 68.4%). Similarly 1,094 of all 'Overseas in 2011' new arrivals were aged 5-45 years (84.1%).

As was the case in 2011 outside of Victoria the key source of new residents to the Mildura LGA (by State) was New South Wales (1,437 residents, or 7.9%) followed by South Australia (962 residents, or 5.3%). Key local government areas included Wentworth (with 492 2011 Census Wentworth residents now residing in the Mildura LGA), Swan Hill (with 317 2011 Census Swan Hill residents now residing in the Mildura LGA) and Broken Hill (with 269 2011 Census Broken Hill residents now residing in the Mildura LGA).

As was the case in the *2012 Social Indicators Report* this section also compares the incomes of longer standing Mildura LGA residents (those who have lived in the area since at least 2011) to new residents to the Mildura LGA. Importantly income ranges were adjusted in this report to reflect the 'low', 'medium' and 'high' income ranges reflected in measure 3.84 *Social distress Family income (low, medium, high, not stated)*.

The measure *Individual Weekly Incomes 2016, by Place of Residence in 2011* reveals that the highest proportion of residents with incomes below \$800 were Mildura LGA residents who were living overseas in 2011 (77.6%) followed by Mildura LGA residents who were living in the Mildura LGA in 2011 (66.2%). The highest proportion of Mildura LGA residents within incomes over \$1,500 were those living in the Melbourne LGA in 2011 (47.4%) followed by those living in Other States in 2011 (10.2%).

Individual Weekly Incomes 2016, by Place of Residence in 2011

Location in 2011*	Below \$800**	\$800-\$1,499	\$1,500+
<b>Mildura LGA</b>	<b>66.2%</b>	<b>24.0%</b>	<b>9.7%</b>
Other States	62.8%	27.0%	10.2%
Melbourne (LGA)	26.3%	26.3%	47.4%
Overseas	77.6%	16.0%	6.4%

Source: ABS TableBuilder, <http://www.abs.gov.au/websitedbs/censushome.nsf/home/tablebuilder>

Proportions Methodology: Numerator – Area Individuals in ‘Individual Weekly Income’ range (i.e. below \$800) / Denominator – Total Individuals in Area

\* Data for this indicator has been collected at the LGA level where stated, i.e. Melbourne is for Melbourne LGA not Greater Capital City Statistical Area (GCCSA) as for other measures

\*\* Includes ‘Negative Income’ and ‘Nil Income’ and all incomes between \$1 - \$799

O.22 **Overview** Stability of Population, 2016, Census of Population and Housing, (2017) (LGA and SA1) *(Table 2.9, 2012 Social Indicators Report)*

As noted in the *2011 Social Indicators Report* whilst stability of population can positively influence social cohesion some level of movement or 'churn' is considered appropriate to 'breathe new life' into the community as well.

The following table shows the number of individuals in each community who have remained at the same address between 2006 and 2011 and 2011 and 2016 and the number of individuals who have moved. Within the Mildura LGA in 2011, the proportion of individuals who had moved address (whether from within the LGA or from outside) since 2006 was 38.8% (the 17,350 who identified as being at a different address divided by the total identifying for both 'same address' and 'different address' [44,774]). Within the Mildura LGA in 2016, the proportion of individuals who had moved address (whether from within the LGA or from outside) since 2011 was slightly greater at 39.9%. Again this was slightly greater than the Regional Victorian trend for 'different address' between the 2011 and 2016 Census of Population and Housing periods at 38.6%.

The community which recorded the highest proportion of movements was Mildura North at 46.0%, by comparison, Mallee Track recorded the lowest proportion of movements at just 14.9%. These results mirror trends set in the *2012 Social Indicators Report*.

Population Stability, 2016

Area*	Same Address in 2006	Different Address in 2006	Same Address in 2011	Different Address in 2011**
Merbein	2,988	1,198	2,784	1,302 (31.9%)

\*\*\*\* Melbourne refers to the Greater Capital City Statistical Area of Melbourne (GCCSA)

O.23 **Overview** Country of Birth, (2016), ABS Census of Population and Housing (2017) (LGA and SA1) *(Table 2.8 2012 Social Indicators Report)*

At the Mildura LGA level there were mostly consistent country of birth outcomes between the 2011 and 2016 Census periods with the highest ranking countries of birth remaining unchanged (Australia, England, Italy and New Zealand). Changes of note include India surpassing Turkey as the fifth most common country of birth and Afghanistan increasing from the eighth most prevalent to seventh. Greece moved out of the top 10 countries of birth with Malaysia moving into the top ten (entering at eighth position). Australia decreased from being the Country of Birth for 84.0% Mildura LGA residents in 2011 to 79.3% in 2016.

The SA1 grouping with the lowest proportion of Australian born residents was Nangiloc / Colignan (69.2%) and the highest was Millewa (90.0%). The SA1 grouping with the highest proportion of Indigenous residents was Mildura North (5.3%) and the lowest was Nichols Point (0.0%).

#### O.24 Country of Birth of Person by Year of Arrival in Australia, 2016, ABS Census of Population and Housing (2017) (LGA)

In the five years from 2006-2010 a total of 759 people who were born overseas arrived into the Mildura LGA to live. The highest three countries of birth arriving into the Mildura LGA (excluding arrivals identified as 'born elsewhere') were India (163 people), Philippines (52 people) and the United Kingdom, Channel Islands and Isle of Man (51 people). By contrast in the five years from 2011-2015 a total of 1,076 people who were born overseas arrived into the Mildura LGA to live. The highest three countries of birth arriving into the Mildura LGA (excluding arrivals identified as 'born elsewhere') were India (112 people), Malaysia (97 people) and New Zealand (78 people).

O.25 **Overview** Households where 'Language other than English' is spoken, 2016, ABS Census of Population and Housing (2017) (LGA) TL

Despite increases in arrivals from people born overseas from 759 people in 2006-2010 to 1,076 people in 2011-2015 there was a decreasing proportion of households where a 'language other than English' is spoken from 13.8% in 2011 to 11.2% in 2016. In 2016 this proportion was less than half the proportion witnessed at the Victorian level (27.8%).

Households where 'Language other than English' is spoken, 2016

Mildura 11.2%

Victoria 27.8%

Time Trend – a decreasing proportion of households in the Mildura LGA where 'Language other than English' is spoken between 2011 and 2016 Census periods ↓

Households where 'Language other than English' is spoken, 2011

Mildura 13.8%

Victoria 27.6%

Across the Mildura LGA's SA2s households where a 'Language other than English' was spoken were recorded, from highest to lowest proportion, as follows: Mildura South 15.0%, Mildura North SA2 12.1%, Irymple SA2 10.0%, Red Cliffs SA2 8.3%, Merbein SA2 6.0%, Mildura Regional 5.0% and in the NSW border communities Wentworth Buronga SA2 5.4%.

## O.26 Overview Migration Stream by Local Government Area, Settlement Date\* range 1 July 2009 – 30 June 2014

Australia's Immigration Programme has two components:

- Migration Programme for skilled and family migrants, and the
- Humanitarian Programme for refugees and others in refugee-like situations (for example asylum seekers).

<https://www.border.gov.au/about/corporate/information/fact-sheets/20planning> accessed 06/05/2017

The 1951 Convention relating to the Status of Refugees (the 1951 Refugee Convention) is the fundamental international legal document that defines a refugee, his/her rights and the legal obligations of countries that are signatories to the 1951 Refugee Convention. Article 1A (2) of the 1951 Refugee Convention defines a **refugee** as:

*"A person who is outside his country of nationality or habitual residence has a well-founded fear of persecution because of his race, religion, nationality, membership in a particular social group or political opinion, and is unable or unwilling to avail himself of the protection of that country, or to return there, for fear of persecution."*

The *Migration Act 1958 (Cwlth)*, considers the person a **refugee** if the person:

a. *In a case where the person has a nationality - is outside the country of his or her nationality and, owing to a well-founded fear of persecution, is unable or unwilling to avail himself or herself of the protection of that country; or*

b. *In a case where the person does not have a nationality - is outside the country of his or her former habitual residence and owing to a well-founded fear of persecution, is unable or unwilling to return to it.*

An **asylum seeker** is less easily defined. In general, an **asylum seeker** is someone who has left their country in search of international protection, but is yet to be recognised as a refugee, in effect, someone who has applied for refugee status and is waiting for a decision. Specifically, this comes under Article 14 of the Universal Declaration of Human Rights, which states that everyone has "...the right to seek and enjoy in other countries asylum from persecution." There are several different classes of bridging visas in Australia applicable to asylum seekers.

It is generally recognised that refugee and asylum seeker health is an important area of healthcare. People of refugee and asylum seeker background are affected by distinct health issues that arise from their experiences both prior to arrival in Australia and after arrival. There is now significant evidence internationally which indicates that people from refugee and asylum seeker backgrounds require particular supports to access primary health care including GP clinics and community health, together with other services including specialist services, hospitals and dental care. <http://nwmpnh.org.au/uploads/ckpg/files/About/NWMPHN-Refugee-Humanitarian-Services-Mapping-Final-Report-October-2016.pdf> accessed 06/05/2017.

Time trend - The 5 year period reported in the 2014 State of Mildura Rural City's Children and Young People Report (1 July 2008 – 30 June 2013) revealed a total migration stream of 952 people. Increases in the 'family' and 'skilled' streams accounts for this overall increase, with the 'humanitarian' stream remaining steady at 321 in the 2008-2013 period and 319 in the 2009-2014 period.

Local Government Area	Migration Stream				Total
	Family (No.) %	Humanitarian (No.) %	Other/Unknown	Skilled (No.) %	
Mildura 1 July 2009 – 30 June 2014 (five year period)*	(372) 35.8%	(319) 30.7%	0	(349) 33.6%	<b>1,040</b>
Mildura 1 July 2015 – 4 July 2016 (one year and one month period)	(90) 41.7%	(42) 19.4%	0	(84) 38.9%	216
Mildura 1 January – 31 March 2017 (three month period)	(22) 33.8%	(8) 12.3%	0	(35) 53.8%	65

\*This table covers the Settlement Date range from 1 July 2009 to 30 June 2014, where 'Settlement Date' refers to the 'date of visa grant' for settlers who were in Australia when their visa was granted and 'date of arrival in Australia' for settlers who were overseas when their visa was granted.

\*\*Please note the matters identified as caveats to this data

#### \*\* Caveats

The Settlement Reporting Facility (SRF) reports on data sourced from the Settlement Database (SDB). There are limitations in the data capture, the actual data and the reporting system. These data limitations are outlined below.

#### Data Limitations

- SRF includes settlers who were:
  - granted a permanent (or provisional) visa after 1/1/1991 and arrived in Australia within 25 months of visa grant, (or are yet to arrive and it has been less than 25 months since their visa was granted), or
  - who arrived in Australia after 1/1/1991 having been granted a permanent (or provisional) visa prior to 1/1/1991.
- SRF has not been adjusted to reflect settlers who are deceased.
- SRF has not been adjusted to reflect settlers who have permanently departed Australia.
- SRF has not been adjusted to reflect settlers who have had their grants cancelled.
- SRF includes some duplicate settler records.
- SRF includes many data items that are not mandatory.
- SRF includes only the settler's **latest** known residential (or intended residential) address. Address information is only updated if the department is notified. Some settlers have no address details recorded.
- SRF location data is based on the 2011 Australian Standard Geographic Classification (ASGC).
- SRF includes only the latest permanent (or provisional) visa for a settler.

## O.27 Religious Affiliation by sex, 2016, ABS Census of Population and Housing (2017) (LGA)

### Religious Affiliation, top responses, 2016

Religious affiliation in the Mildura LGA shows higher proportions of affiliation to the Anglican, Not stated and Uniting Church religions than witnessed at the Victorian level but lower overall religious affiliation at the Mildura LGA level ('No Religion, so described' 33.5% in the Mildura LGA compared to 'No Religion, so described' 31.7% at the Victorian level).

Source: 2016 ABS Census of Population and Housing, Quickstats, Mildura LGA and SA2s  
[http://www.censusdata.abs.gov.au/census\\_services/getproduct/census/2016/quickstat/](http://www.censusdata.abs.gov.au/census_services/getproduct/census/2016/quickstat/)  
 accessed 26/06/2017

	Mildura (RC)	Victoria
No Religion, so described	33.5% (18,021)	31.7% (1,876,738)
Catholic	22.1% (11,911)	23.2% (1,377,134)
Anglican	11.9% (6,410)	9.0% (530,710)
Not stated	10.6% (5,708)	9.4% (555,956)
Uniting Church	6.7% (3,583)	3.3% (197,572)

Religious Affiliation is presented in more detail in the table below. With the broad classification of 'Christianity' constituting the largest single group (27,958 persons) followed by 'Secular Beliefs and Other Spiritual Beliefs and No Religious Affiliation' (18,175 persons). Excluding the different groupings falling within 'Christianity' (i.e. Catholic etc), 'No Religion, so described' and 'Religious affiliation Not stated or Inadequately described' are the next largest groupings followed by 'Islam' (942 persons) and 'Buddhism' (536 persons).

## Domain 1: Victorians are healthy and well

### Outcome 1.1: Victorians have good physical health

#### *INDICATOR - Increase healthy start in life*

Infant and child death rates offer insight into the social and environmental conditions in which Australian children grow and develop. Death rates have halved for Australian infants and children under the age of five years over the last two decades, largely as a result of improved neonatal intensive care, increased community awareness of the risk factors for injury and Sudden Infant Death Syndrome (SIDS), and reductions in vaccine-preventable diseases through national childhood immunisation programs. However, rates among Indigenous children and children from remote areas remain much higher than the national rate. High rates of infant and child mortality are also strongly associated with social and economic disadvantage. Socioeconomic status affects infant and child survival through a number of proximate determinants including maternal factors (such as age, parity, birth interval), environmental contamination, nutritional deficiency, injury, individual preventive measures and access to effective medical treatment. <http://phidu.torrens.edu.au/notes-on-the-data/health-status-disability-deaths/deaths-child-1-4>

**1.1 Happy and Healthy** Children have a healthy childhood, Infant Deaths (all deaths under 12 months of age per 1,000 live births), 2010–2014, Public Health Information Development Unit (LGA) TL

Review of data analysed by the Public Health Information Development Unit (PHIDU) revealed the rate of infant deaths in the Mildura LGA, whilst remaining above the Victorian rate, had decreased between the 2006–2010 and 2010–2014 reporting periods.

#### Infant Deaths (all deaths under 12 months of age per 1,000 live births), 2010–2014

Mildura 4.3

### 1.2 Happy and Healthy Children have a healthy childhood, Child Mortality (1 to 4 years, average annual rate per 100,000), 2008-2012, Public Health Information Development Unit (LGA) TL

Review of data analysed by the Public Health Information Development Unit (PHIDU) indicated a decline in the actual number of deaths to children aged 1-4 years between 2006-2010 and 2008-2012 from 5 deaths during 2006-2010 to between 1-4 deaths during 2008-2012 (where 1-4 deaths are recorded as # - not shown). This allows us to report a decrease in child mortality in the Mildura LGA between 2006-2010 and 2008-2012, it does not allow analysis to provide comparison to the Victorian level rates.

#### Child Mortality (1 to 4 years), average annual rate per 100,000, 2008 - 2012

Mildura .. (#) Traffic light cannot be determined

Victoria 16.8

Time Trend – trend data for Child Mortality (1 to 4 years) cannot be determined for the 2006-2010 and 2008-2012 reporting periods as 2008-2012 data was 'not shown' (#). However review of actual numbers reveals five children aged 1-4 years died in the Mildura LGA between 2006-2010, from protocols regarding 'not shown' data we understand that between 2008-2012 somewhere between one and four children aged 1-4 years died (as indicated by #). Cases where no children aged 1-4 years die are recorded as '0'.

#### Child Mortality (1 to 4 years), average annual rate per 100,000, 2006-2010

Mildura 36.3 (5)

Victoria 16.9

#### 1.4 1.1.1.2 Proportion of babies born of low birth weight, Victorian Perinatal Data Collection (VPDC) DHHS

Happy and Healthy Children have a healthy childhood, Low birth weight babies, 2013-2015

Health Low birth weight babies (LGA) TL (Section 4.8 2012 Social Indicators Report)

Low birth weight is a key measure of infant health and a principal determinant of a baby's chance of prospective survival, good health, development and wellbeing. The measure of 'low birth weight' is understood as the number of births where the birth weight was less than 2,500 grams ('low birth weight') or less than 1,500 grams ('very low birth weight'), expressed as a percentage of all live births.

Epidemiological observations show that infants weighing less than 2,500g are approximately 20 times more likely to die than heavier babies. The incidence of low birth weight is higher in the developing world compared with the developed world. Low birth weight is an indicator of potential lifelong consequences to individuals, families and communities at large.

A baby's low weight at birth is either the result of preterm birth (before 37 weeks' gestation) or due to restricted fetal (intrauterine) growth. Low birth weight is a major determinant of mortality, morbidity and disability in infancy and childhood, and also has a long-term impact on health outcomes in adult life. Many factors affect the duration of gestation and foetal growth, and may relate to the infant, the mother or the physical environment.

Mothers in deprived socioeconomic conditions frequently have low birth weight infants. In those settings, low birth weight stems primarily from the mother's poor nutrition and health over a long period of time, including during pregnancy, the high prevalence of specific and non-specific infections, or from pregnancy complications, underpinned by poverty [www.health.vic.gov.au/healthstatus/composite/your-health/current.htm](http://www.health.vic.gov.au/healthstatus/composite/your-health/current.htm)

The reporting of this measure in the *Mildura Rural City Council Social Indicators Report (2014)* revealed that between 2006 and 2009 in Mildura LGA, an average of 6.5% of babies born were low birth weight babies compared to approximately 6% of all babies at the national level in 2008. For the 2009-2011 period (as reported in the *State of Mildura Rural City's Children and Young People Report 2014*) the proportion of low birth weight babies for the Mildura RCC (LGA) had increased to 7.0%. For the 2013-2015 reporting period this proportion had further increased to 7.3%. At each reporting point the Mildura LGA rate was above that reported at the Victorian level.

Low birth weight data reported by the Victorian Department of Health in the *2014 Mildura (RC)* profile ranks the Mildura LGA as 36<sup>th</sup> amongst the 79 Victorian LGAs with the highest proportion of low birth weight babies. <https://www2.health.vic.gov.au/about/publications/policiesandguidelines/Mildura%20RC> Accessed 13/03/2017

### 1.5 1.1.1.3 Proportion of mothers who smoked tobacco in the first 20 weeks of pregnancy, 2013-2015, Victorian Perinatal Data Collection (VPDC) DHHS

Smoking during pregnancy can cause serious pregnancy-related health problems including complications during labour and an increased risk of miscarriage, premature birth, stillbirth, low birth weight and sudden unexpected death in infancy. Smoking during pregnancy is the most important modifiable determinant of low birth weight and infant mortality.

Source: Department of Health and Human Services, (2017). Victorian public health and wellbeing outcomes framework data dictionary.

\* A Quit Intervention involves providing the client with the 'Quit pack' and supporting with appropriate strategies if they show interest in quitting smoking but do not want Maternal and Child Health to refer them into the Quit Program. Clients can then refer themselves via the 'Quit pack' if they choose to.

\*\* A Quit Referral occurs when the Maternal and Child Health nurse directly refers the client into the Quit Program via the referral form.

## 1.10 1.1.1.4 Proportion of children exposed to alcohol in utero, 2013, Victorian Child Health and Wellbeing Survey DET (Mallee Region only) TL

Maternal alcohol consumption can disrupt foetal development at any stage during a pregnancy, including at the earliest stages before a woman knows she is pregnant. Binge drinking (defined as consuming four or more drinks per occasion) and regular heavy drinking, places a foetus at the greatest risk for severe problems. There is no known safe level of alcohol consumption during pregnancy. [www.health.vic.gov.au/about/health-strategies/public-health-wellbeing-plan](http://www.health.vic.gov.au/about/health-strategies/public-health-wellbeing-plan)

Data for the Mallee Region (not Mildura LGA) indicates that considerably less children in the Mallee Region are 'exposed to alcohol in utero' than their Victorian counterparts. Trend data is not available for this measure.

### Proportion of children exposed to alcohol in utero, 2013

Mallee Region 37.0%

Victoria 46.7%

Time Trend – data not available on VCAMS

<http://www.education.vic.gov.au/about/research/Pages/vcamstableau.aspx> Accessed 28/04/2017

1.11 **Developing Well** Children visit a maternal and child health nurse- all children (all scheduled KAS checks), 2014/2015 DET Maternal and Child Health Annual Data Report (LGA) TL

The Maternal and Child Health (MCH) Service in Victoria delivers a free, universally accessible statewide service to all families with children aged from birth to school age. Child Health Assessments (referred to as Key Ages and Stages) are routinely undertaken by the Maternal and Child Health Service to monitor child health and development. Ten visits are anticipated according to key ages and stages until a child reaches 3.5 years of age, including an initial home visit. Data relating to the activities of the Maternal and Child Health Service are collated on a financial year basis by the Department of Education and Training.

MCH nurses assess and monitor the health, growth and development of children and provide information and advice on breastfeeding, appropriate nutrition, child behaviour, parenting and maternal physical and emotional health and wellbeing. MCH services also deliver a flexible service component, including first time parents groups, other group sessions, additional consultations and community strengthening activities (DEECD, 2013).

Nationally and internationally health experts support the concept of universal access primary health care services for young children and their families. Primary health care services are believed to be the most appropriate and effective platform for improving the health, development and wellbeing of children through early detection, prevention and health promotion. Importantly, opportunities for sequential health monitoring and surveillance outside the Maternal and Child Health Service have been reduced in the past decade for many families by factors such as early discharge from maternity hospitals, non-universal take-up of the medical postnatal check at six weeks, and children born overseas without access to primary care services. These factors taken together with the increasing complexity of Australian families emphasise the critical role of the Maternal and Child Health nurse (Local Logic Place, 2012).

Comparison of the 2014/2015 Mildura LGA KAS data indicates at every check participation rates have improved based on 2012/2013 data except for the 4 months check where the participation rate remained stable at 95%. Analysis also reveals the 2014/2015 Mildura LGA KAS participation rates sit above the Victorian rates for all checks but the 18 months and 2 years checks, both of which sit slightly below the Victorian participation rates.

## 1.12 **Developing Well** Children visit a maternal and child health nurse - ATSI children (all scheduled KAS checks), 2014/2015, DET Maternal and Child Health Annual Data Report (LGA) TL

Within the Mildura LGA Aboriginal and Torres Strait Islander families can access Maternal and Child Health services from either (or both) the Mildura Rural City Council and the Mallee District Aboriginal Service (MDAS). The availability of an alternate provider to mainstream Maternal and Child Health service provision should be considered as a factor in the following KAS participation results for the Mildura Rural City Council.

Comparison of the 2014/2015 Mildura LGA KAS data for Aboriginal and Torres Strait Islander children against the 2012/2013 data reveals little consistency in participation trends, for example: there were increasing participation rates for six of the 10 KAS checks with the 2, 4 and 8 weeks checks, the 12 and 18 months checks and the 2 years check increasing between the 2014/2015 and 2012/2013 reporting periods. In contrast there were decreasing participation rates for four of the 10 KAS checks with the home visit, 4 and 8 months checks and 3.5 years check decreasing between the 2014/2015 and 2012/2013 reporting periods. In 2014/2015 only two of the 10 KAS check participation rates were above their Victorian counterparts (these were for the 2 weeks and 4 weeks checks).

**Note:** A referral implies that counselling has also occurred at the time of the referral consultation. A Referral is a more formal process, where a written letter, a phone call to the referral agency is made. This table refers to 'instances' of referrals, for example, a parent may have more than one referral during a consultation.

\* Proportions of 'Reason for referral' are ascertained where numerator is 'reason' and denominator is 'total' number of referrals

"DDH" stands for Developmental Dysplasia of the Hip

## Domain 1: Victorians are healthy and well

### Outcome 1.1: Victorians have good physical health

#### *INDICATOR - Reduce premature death*

##### 1.14 Deaths from all avoidable causes, persons aged 0 to 74 years 2010-2014, (LGA) TL

*“those causes of death that are potentially avoidable at the present time, given available knowledge about social and economic policy impacts, health behaviours, and health care ...”* [www.publichealth.gov.au](http://www.publichealth.gov.au)

Within Australia it is understood that the rates of avoidable mortality are approximately 80% higher in the most disadvantaged areas compared to the least disadvantaged areas. There is also a clear socioeconomic gradient in rates for all causes of avoidable mortality and for most conditions examined. Nationally the key causes of death contributing to avoidable mortality statistics include neoplasms (cancers); cardiovascular diseases; infections; nutritional, endocrine and metabolic conditions (such as diabetes); respiratory diseases; drug use disorders; and unintentional and intentional injuries. [www.publichealth.gov.au](http://www.publichealth.gov.au)

Deaths are defined as avoidable in the context of the present health system, based on the PI-16 Potentially avoidable deaths from the National Healthcare Agreement (NHA) (2015). The data presented below are the average annual indirectly age-standardised rates per 100,000 males/ females/ people (aged 0 to 74 years); and/or indirectly age-standardised ratios, based on the Australian standard. Not all of the causes of avoidable mortality are shown in this atlas as some have too few cases to be reliable indicators at the small area level. [http://phidu.torrens.edu.au/current/data/sha-aust/notes/phidu\\_data\\_sources\\_notes.pdf](http://phidu.torrens.edu.au/current/data/sha-aust/notes/phidu_data_sources_notes.pdf) Accessed 21/04/2017

Review of the following three measures (deaths from all avoidable causes, persons, males and females) reveals that for each the Mildura LGA is above the Victorian rate and experiencing increasing rates of avoidable deaths. This is particularly so for males.

Deaths from all avoidable causes (rates per 100,000), persons aged 0 to 74 years\* 2010-2014

Mildura 141.4

Victoria 108.6

Time Trend – increasing rate of deaths from all avoidable causes between 2009-2013 to 2010-2014 ↑

Deaths from all avoidable causes (rates per 100,000), persons aged 0 to 74 years\* 2009-2013

#### 1.1.2.2.A Premature death rate due to cancer, cardiovascular disease, diabetes and chronic respiratory disease

The following data was produced by the Public Health Information Development Unit (PHIDU) from deaths data based on the 2010 to 2014 Cause of Death Unit Record Files supplied by the Australian Coordinating Registry and the Victorian Department of Justice, on behalf of the Registries of Births, Deaths and Marriages and the National Coronial Information System. The population at the Statistical Areas Level 2 is the ABS ERP for Australia, 30 June 2010 to 30 June 2014.

#### 1.1.7 Avoidable deaths per 100,000 population, 0–74 years, due to cardiovascular diseases, 2010-2014, Public Health Information Development Unit & DHHS (LGA) (TL / R)

Avoidable deaths for people aged 0-74 years due to cardiovascular diseases increased between the 2009-2012 and 2010-2014 reporting periods, continuing to sit above their Victorian counterparts for both reporting periods.

##### Avoidable deaths per 100,000 population, 0–74 years, due to cardiovascular diseases\*, 2010-2014

Mildura 29.7

Victoria 21.5

Time Trend – avoidable deaths per 100,000 due to cardiovascular diseases reduce by almost half between the 2003-2007 and 2009-2012 reporting periods before increasing again in 2010-2014 (although remaining well below the 2003-2007 rates). However the dramatic change in the Victorian rates during the 2003-2007 period suggests a change in reporting protocol. Between the 2009-2012 and 2010-2014 reporting periods the rate of cardiovascular diseases increased ↑

##### Avoidable deaths per 100,000 population, 0–74 years, due to cardiovascular diseases\*, 2009-2012

Mildura 25.5

Victoria 23.0

Rank 44

##### 2003-2007

#### 1.1.2.2.C Premature death rate due to coronary heart disease

#### 1.21 1.1.2.2.D Premature death rate due to stroke (cerebrovascular diseases)

Avoidable deaths (ASR) per 100,000 population, 0-74 years, due to cerebrovascular diseases, 2010-2014, Public Health Information Development Unit, 2017, (LGA) TL

Stroke occurs when an artery supplying blood to the brain suddenly becomes blocked (ischaemic stroke) or bleeds (haemorrhagic stroke). Often this causes paralysis of parts of the body normally controlled by that area of the brain, or speech problems and other symptoms. Stroke is a major contributor to the burden of disease in Australia. In many, but not all, cases stroke is preventable because many of its risk factors, including high blood pressure, physical inactivity, overweight or obesity and tobacco smoking, are modifiable (AIHW 2014).

Avoidable deaths for people aged 0-74 years due to cerebrovascular diseases increased between the 2009-2013 and 2010-2014 reporting periods, moving from sitting below their Victorian counterparts in 2009-2013 to above in 2010-2014.

Avoidable deaths (ASR) per 100,000 population, 0-74 years, due to cerebrovascular diseases, 2010-2014

Mildura 8.3

Victoria 8.0

Time Trend – increasing rates of cerebrovascular diseases between the 2009-2013 and 2010-2014 reporting periods ↑

Avoidable deaths (ASR) per 100,000 population, 0-74 years, due to cerebrovascular diseases, 2009-2013

Mildura 7.6

Victoria 8.0

Source: Social Health Atlas of Australia, Victoria, Data by Local Government Area. Published June 2017

## 1.22 1.1.2.2.E Premature death rate due to cancer

Avoidable deaths per 100,000 population, 0-74 years, due to cancer, 2010-2014, Public Health Information Development Unit, 2017 (LGA) (TL / R)

Avoidable deaths for people aged 0-74 years due to cancer increased between the 2009-2012 and 2010-2014 reporting periods, moving from sitting below their Victorian counterparts in 2009-2012 to above in 2010-2014.

Avoidable deaths per 100,000 population, 0-74 years, due to cancer, 2010-2014

Mildura 31.1

Victoria 28.6

Time Trend – the significantly decreasing rates of avoidable deaths due to cancer over the 2003-2007 – 2009-2012 reporting period reversed to see rates increase again for the 2010-2014 reporting period. However the dramatic change in the Victorian rates during the 2003-2007 period suggests a change in reporting protocol. Between the 2009-2012 and 2010-2014 reporting periods the rate of cancer in the Mildura LGA increased ↑

Avoidable deaths per 100,000 population, 0–74 years, due to cancer, 2009-2012

<http://www.aihw.gov.au/deaths/mort/> Accessed: 21/04/2017

**Premature deaths:** Number of deaths due to all causes among people aged under 75.

**Premature deaths (% of total deaths):** Premature deaths as a proportion of all deaths (all ages). Premature deaths as a proportion of all deaths is suppressed where there are fewer than 10 total deaths for an area, by year and sex.

**Premature deaths age-standardised rate (per 100,000):** Number of premature deaths due to all causes per 100,000 population aged under 75. Rates are standardised to a specific standard age structure to facilitate comparison between populations and over time. Age-standardised rates are directly standardised to the Australian estimated resident population at 30 June 2001. Rates are expressed as deaths per 100,000 males/females/persons aged under 75 for each geographic area. Rates are suppressed where the population in any age group in an area is less than 30, or where there are fewer than 20 premature deaths in an area, by year and sex.

**Potential years of life lost (PYLL):** Summary measure of premature deaths. PYLL represents the total number of years not lived by an individual before an arbitrary upper limit to life, in this workbook age 75. For example, if dying before the age of 75 is considered premature then a person dying at age 40 would have lost 35 person-years of potential life lost.

**PYLL under 75 (person-years):** PYLL is presented here in person-years of potential life lost.

**PYLL under 75 rate (per 1,000):** Rates are calculated using the sum of estimated resident populations at 30 June for each year. Rates are expressed as person-years per 1,000 males/females/persons for each geographic area. Rates are suppressed where the total population for an area is less than 100, by year and sex.

**Potentially avoidable deaths (PAD):** Measure of health system performance. Deaths among people aged under 75 that are avoidable in the context of the present health care system. PADs include deaths from conditions that are potentially preventable through individualised care and/or treatable through existing primary or hospital care. PADs are classified using nationally agreed definitions (AIHW 2016. National Healthcare Agreement: PI 16-Potentially avoidable deaths, 2016. Viewed 07 December 2016, <<http://meteor.aihw.gov.au/content/index.phtml/itemId/598750>>).

**PAD:** Number of deaths that are potentially avoidable among people aged under 75.

**PAD (% of premature deaths):** Potentially avoidable deaths as a proportion of all premature deaths. Potentially avoidable deaths as a proportion of all premature deaths is suppressed where there are fewer than 10 premature deaths for an area, by year and sex.

**PAD age-standardised rate (per 100,000):** Number of potentially avoidable deaths due to all causes per 100,000 population aged under 75. Rates are standardised to a specific standard age structure to facilitate comparison between populations and over time. Age-standardised rates are directly standardised to the Australian estimated resident

population at 30 June 2001. Rates are expressed as deaths per 100,000 males/females/persons aged under 75 for each geographic area. Rates are suppressed where the population in any age group in an area is less than 30, or where there are fewer than 20 potentially avoidable deaths in an area, by year and sex.

#### 1.24 Leading causes of death, (premature or not), 2010–2014, Australian Institute of Health and Welfare (2017)

Three of the 20 leading causes of death listed for the Mildura LGA are not shared with their Victorian counterparts, this includes: Other ill-defined causes (R00–R94, R96–R99, I46.9, I95.9, I99, J96.0, J96.9, P28.5), Liver disease (K70–K76) and Melanoma (C43). Of the 17 remaining leading 20 causes of death (premature or not) shared by the Mildura LGA and Victoria Mildura LGA has a higher age-standardised rate for 14 of these causes (shown in the table below in red) and a lower age-standardised rate for three of these causes.

	Rank	Cause of death	Deaths	Per cent of all causes	Crude rate (per 100,000)	Age-standardised rate (per 100,000)	Rate ratio (relative to all of Australia)
Mildura (RC)	1	Coronary heart disease (I20–I25)	281	13.2	107.5	77.8	1.03
	2	Lung cancer (C33, C34)	124	5.8	47.5	36.5	1.15
	3	Chronic obstructive pulmonary disease (COPD) (J40–J44)	119	5.6	45.5	33.6	1.45
	4	Cerebrovascular disease (I60–I69)	118	5.5	45.2	31.9	0.81
	5	Dementia and Alzheimer disease (F01, F03, G30)	107	5.0	40.9	27.2	0.74
	6	Diabetes (E10–E14)	82	3.8	31.4	22.8	1.44

Drawing on five years of data collated by the Australian Institute of Health and Welfare (2017) in their *Mortality Over Regions and Time books: Local Government Areas* would confirm minimal change in life expectancy rates (although this data is for both men and women so more accurate estimates are masked). According to the Mortality Over Regions and Time assessments for the Mildura LGA the five year median age at death was 80.7 years whilst at the Victorian level it was 81.8 years.

Life Expectancy (years), 2017

## Domain 1: Victorians are healthy and well

### Outcome 1.1: Victorians have good physical health

#### *INDICATOR – Reduce preventable chronic diseases*

Chronic diseases such as cancer, coronary heart disease and diabetes are becoming more common in Australia due to our ageing population and to social and lifestyle factors. Improvements in medical care have also enabled us to live longer with illnesses and diseases, and have provided access to treatments not available in the past.

Chronic diseases are the largest cause of premature death and ill health in Victoria, as well as the largest cause of the difference in health between population groups and geographic areas. Cancer, cardiovascular disease, diabetes and chronic respiratory disease are the main preventable causes of premature death. The four lifestyle behaviours of poor nutrition, physical inactivity, smoking and excess alcohol are important risk factors for these chronic diseases (DHHS, 2017a).

In 2014–15, based on self-reported data from the NHS, more than 11 million Australians (50%) had at least one of eight selected chronic conditions (arthritis, asthma, back problems, cancer, chronic obstructive pulmonary disease, cardiovascular disease, diabetes mellitus, or a mental or behavioural condition) (ABS 2015e). Of these people, 5.3 million had two or more of the eight conditions (AIHW, 2016, p13).

In 2013, coronary heart disease was the leading underlying cause of death in Australia, followed by dementia and Alzheimer disease, and cerebrovascular disease (predominantly stroke). The fourth leading underlying cause of death was lung cancer and the fifth was chronic obstructive pulmonary disease. When considering broad groups of diseases, such as all types of cancer combined or all cardiovascular disease (which includes coronary heart disease, stroke and heart failure), cancer contributed to the most deaths in 2013. This was the first time that the total number of deaths (nationally) due to all types of cancer combined surpassed the total number of deaths due to all cardiovascular disease (44,100 and 43,600 respectively) (AIHW, 2016, p11).

#### 1.26 Percentage of persons reporting type 2 diabetes, 2011, Victorian Population Health Survey (LGA) TL / R

*“Five per cent of the adult Victorian population have been diagnosed with type 2 diabetes mellitus. The prevalence of type 2 diabetes has increased by about 50 per cent in Victoria between 2003 and 2011–12” (DHHS, 2014).*

*“22% of the diabetes national burden is due to dietary risks. A further 71% of the diabetes burden is due to high body mass” (DHHS, 2015).*

Diabetes mellitus is a common chronic condition characterised by high blood glucose (sugar) levels. The two main types of diabetes mellitus are type 1 (insulin-dependent) diabetes and type 2 diabetes. Gestational diabetes affects women when higher than normal blood glucose is diagnosed during pregnancy, although they have had no prior diagnosis of diabetes. This condition usually abates after birth but is a risk factor for mothers and babies developing type 2 diabetes later in life.

Type 1 diabetes is an autoimmune disease in which the body's immune system destroys the insulin-producing cells of the pancreas, rendering the individual unable to produce enough of the hormone insulin, which is essential for the control of glucose levels in the blood. It usually has onset in childhood and adolescence but can be diagnosed at any age. People with type 1 diabetes require replacement insulin therapy for life. Type 1 diabetes accounts for approximately 10–15% of diabetes mellitus.

Type 2 diabetes is the most common form of diabetes accounting for around 85% of all cases of diabetes mellitus. Modifiable risk factors for type 2 diabetes include physical inactivity, poor diet, overweight/obesity, tobacco smoking, high blood pressure and high blood lipids. Type 2 diabetes is caused by insufficient production of insulin and/or the body becoming resistant to insulin being produced by the pancreas. In many cases, lifestyle modifications including appropriate diet and exercise can help control type 2 diabetes. More severe cases require treatment with blood glucose lowering medication, insulin injections, or a combination of these. Left untreated, diabetes mellitus can cause kidney disease, eye and nerve damage, heart disease, stroke, limb amputation and impotence (DHHS, 2014).

#### Percentage of persons reporting type 2 diabetes, 2011

Mildura 5.3%

Victoria 5.0%

Rank 29

\*Note this measure is not reported in the 2014 VPHS.

#### 1.27 Percentage of persons reporting high blood pressure, 2014, Victorian Population Health Survey (LGA) TL / R

High blood pressure (hypertension) is a major risk factor for ischaemic heart disease, stroke, heart failure and kidney failure. The risk of disease increases with increases in blood pressure. The modifiable causes of high blood pressure include having a poor diet (especially a high salt intake), being overweight or obese, having high levels of alcohol consumption and insufficient levels of physical activity (DHHS, 2014, p137).

#### Percentage of persons reporting high blood pressure, 2014

Mildura 28.1%

Victoria 25.9%

Rank 30

Time Trend – across the Mildura LGA there was an increasing proportion of the population reporting they have been told by a doctor they have high blood pressure between the 2011 and 2014 VPHS reporting periods ↑

For both survey periods the Mildura LGA self-reported higher proportions of people with high blood pressure than their Victorian counterparts.

#### 1.28 Percentage of persons reporting asthma, 2011-2012, Victorian Population Health Survey (LGA) TL / R

Asthma is a long-term lung condition. People with asthma have sensitive airways in their lungs which react to triggers, causing a 'flare-up'. In a flare-up, the muscles around the airway squeeze tight, the airways swell and become narrow and there is more mucus. These things make it harder to breathe. An asthma flare-up can come on slowly (over hours, days or even weeks) or very quickly (over minutes). A sudden or severe asthma flare-up is sometimes called an asthma attack. One in nine people in Australia has asthma and it affects people of all ages. <https://www.asthmaaustralia.org.au/national/about-asthma/what-is-asthma>

#### 1.29 Percentage of persons reporting arthritis, 2011-2012, Victorian Population Health Survey (LGA) TL / R

Arthritis is often referred to as a single disease. In fact, it is an umbrella term for more than 100 medical conditions that affect the musculoskeletal system, specifically joints where two or more bones meet. Arthritis-related problems include pain, stiffness, inflammation and damage to joint cartilage (the tissue that covers the ends of bones, enabling them to move against each other) and surrounding structures. This can result in joint weakness, instability and deformities that can interfere with the most basic daily tasks such as walking, driving a car and preparing food.

Arthritis is the major cause of disability and chronic pain in Australia, with 3.85million Australians affected at a cost to our economy of more than \$23.9 billion each year in

medical care and indirect costs such as loss of earnings and lost production. As the population ages, the number of people with arthritis is growing. According to leading researcher Access Economics, current trends suggest that, by 2050, 7 million Australians will suffer from some form of arthritis.

### 1.30 Sun protective behaviour, population aged 18 years and over, 2011-12, Victorian Population Health Survey 2011-12

In 2011–12 Victorian Population Health Survey respondents were asked a series of questions about eye health including whether respondents had ever seen an eye specialist, the timing of their last visit, whether they had been diagnosed with a specific eye condition and whether they usually wore a hat or sunglasses when out in the sun.

The significance of this final question, which is reported below, is related to the cumulative exposure to ultraviolet (UV) radiation in increasing the risk of developing cataracts as well as pterygium (tissue growth that can block vision), skin cancer around the eyes and degeneration of the macula (the part of the retina where visual perception is most acute).

Research has shown that eye protection when out in sunlight is strongly recommended by health professionals as a means of reducing the risk of the aforementioned adverse outcomes. Such protection should include UV-blocking sunglasses and a hat.

Survey respondents were asked ‘When you go out in the sun do you usually wear a hat and do you usually wear sunglasses?’. Overall, 39.3% of Victorians wore both sunglasses and a hat, while 15.6% wore neither. A significantly higher proportion of men wore both a hat and sunglasses compared with their female counterparts. However, men were also more likely than women not to wear either (17.9% versus 13.3%). Victorian women were more likely to wear sunglasses than Victorian men (80.3% versus 66.6%), while men were more likely to wear hats than women (59.1% versus 40.9%). There was an age-related pattern, where significantly lower proportions of men and women aged 18-34 years wore a hat and sunglasses compared with all Victorian men and women, while significantly higher proportions of men and women aged 35-65 years or over wore a hat and sunglasses.

Within the Mildura LGA Victorian Population Health Survey results for the 2011-12 reporting period revealed higher rates of ‘sun protective behaviours’ (46.2%) than their Victorian counterparts (39.0%).

Sun protective behaviours (wore both hat and sunglasses), 2011-12\*

Mildura 46.2%

Victoria 39.0%

<https://www2.health.vic.gov.au/public-health/population-health-systems/health-status-of-victorians/survey-data-and-reports/victorian-population-health-survey/victorian-population-health-survey-2011-12> Accessed 22/04/2017

### 1.31 Percentage of persons reporting heart disease, 2014, Victorian Population Health Survey (LGA) TL / R

*“79% of the coronary heart disease burden is due to dietary risks and 33% of the coronary heart disease burden is due to high body mass. A further 22% of the national coronary heart disease burden is due to smoking” (DHHS, 2015).*

Ischaemic heart disease was the largest single cause of disability-adjusted life years for both men and women in 2001, accounting for about 10.3% and 8.1% of the total burden in Victorian men and women respectively. Prevalence increases with age and the major risk factors associated with the disease include tobacco smoking, poor nutrition, overweight/obesity, insufficient physical activity, diabetes, high blood pressure and high cholesterol. Further the prevalence of heart disease was about twice as high in men with an annual household income of less than \$20,000 compared with those with incomes of \$100,000 or more (DHHS, 2014).

Based on findings from the 2014 Victorian Population Health Survey a lesser proportion of the Mildura LGA population is reporting heart disease (7.0%) compared to their Victoria counterparts (7.2%). Time trend data indicates a decreasing proportion of the Mildura LGA reporting they have been told by a doctor they have heart disease between the 2011-2012 and 2014 VPHS reporting periods.

### 1.32 Percentage of persons reporting osteoporosis, 2014, Victorian Population Health Survey (LGA) TL / R

Osteoporosis is a common disease affecting over 1 million Australians. This disease makes bones become brittle leading to a higher risk of breaks than in normal bone. Osteoporosis occurs when bones lose minerals, such as calcium, more quickly than the body can replace them, causing a loss of bone thickness (bone density or mass).

A higher percentage of Mildura LGA residents reported osteoporosis (6.5%) compared to their Victorian counterparts (5.2%). An increasing proportion of the Mildura LGA population reported being told by a doctor they have osteoporosis, or thin and weak bones that may break easily between the 2011-2012 and 2014 VPHS reporting periods.

### 1.33 Cancer incidence per 100,000 population, Cancer incidence per 100,000 females, Cancer incidence per 100,000 males, 2014, Victorian Cancer Registry (LGA) TL / R

*“At the Victorian level there has been a general increase in the incidence of cancer over the past two decades, as a result of population ageing. At least one in three Victorians will develop cancer by the age of 75, with the risk higher in males compared with females. The most common cancers are prostate, breast, bowel, lung and melanoma. Despite the increase in cancer incidence, mortality rates from cancer have declined since 1982, reflecting earlier detection of cancers through screening, falling tobacco use and improved treatments” (DHHS, 2014).*

The term ‘cancer’ refers to a group of more than 100 diseases characterised by uncontrolled growth and the spread of abnormal cells. Cancers are distinguished from one another by the location in the body in which the disease began and/or by the type of cell involved. Different types of cancers have different causes and different rates of occurrence and survival.

Cancers may be caused by a variety of factors acting alone or together, usually over a period of many years. For most cancers the causes are not fully understood. However, some factors that place individuals at a greater risk for cancer are well recognised. Lifestyle factors that increase the risk for specific cancers include tobacco use, excessive alcohol consumption, poor diet (with excess calories, high in fat and low in fruits, vegetables or fibre), obesity and physical inactivity, and exposure to ultraviolet light from the sun. Other important risk factors include occupational exposures, environmental factors and reproductive and hormonal factors in women. A family history of cancer may also increase the chance of developing cancer (AIHW & Australian Association of Cancer Registries 2012). Further to these incidence of cancer increases with age, in 2012 it was estimated that 75% of new cancer cases were diagnosed in men and 65% in women aged 60 or older (DHHS, 2014).

The following measures report the rate of malignant cancers newly diagnosed in 2014 for the total population, males and females. For the entire Mildura LGA population there was a rate of 5.9 newly diagnosed malignant cancers in 2014, above the Victorian rate of 5.2. For Mildura LGA males the difference was more pronounced with 6.4 newly diagnosed malignant cancers in 2014, above the Victorian rate of 5.6. For Mildura LGA females the difference was also more pronounced with 5.5 newly diagnosed malignant cancers in 2014, above the Victorian rate of 4.8

#### 1.34 People with dementia (estimated) per 1,000 population, 2016, Alzheimer's Australia (LGA)

Dementia is not the name of a specific disease; rather, it describes a syndrome characterised by the gradual impairment of brain function. Skills commonly affected include memory, cognition and personality. While dementia is irreversible and progressive, it is not an inevitable part of ageing. There is no simple test to diagnose it, and more than 100 diseases are associated with the condition—the most common types are Alzheimer disease and vascular dementia. Alzheimer disease accounts for up to 80% of cases, although only half of these are estimated to be 'pure' Alzheimer disease (AIHW, 2016).

Dementia presents a significant challenge to health and aged care in Australia, and affects almost 1 in 10 (8.8%) people aged 65 and over. Based on rates derived from published international and local studies and on Australian population projections, there are an estimated 354,000 people with dementia in Australia in 2016. The prevalence of dementia has increased—it affected approximately 252,000 people in 2006, which represents an increase of 40% to 2016. Just over 1% of people with dementia are estimated to be under 60, while people aged 85 and over account for 43% of cases. While dementia is not caused by age, it does primarily affect older people (AIHW, 2016).

A number of factors are associated with the development of dementia—for instance, a robust evidence base suggests that higher levels of education in early life reduce the risk of dementia, while higher levels of high blood pressure in mid-life and diabetes in late life increase it (AIHW, 2016).

The ‘people with dementia’ measure reported below relies on estimates and should be considered with caution. However these figures see the Mildura LGA ranked 36<sup>th</sup> of the 79 Victorian LGAs in dementia with 19.4 people per 1,000 population compared to the Victorian rate of 16.8 people per 1,000 population.

## Health Screening and Checks

Measures pertaining to participation in Health Screening Checks were not included in the *Victorian public health and wellbeing outcomes framework 2016* however the decision was made to include several key indicative measures in the *2018 State of Mildura Rural City Report*. These measures are reported below. Time trend data was applied retrospectively where available.

### H.1 Percentage of breast cancer screening participation, 2013-2015, BreastScreen Victoria (LGA) TL / R

The BreastScreen Australia Program in Victoria aims to achieve significant reductions in mortality and morbidity from breast cancer by detecting the cancer early, when treatment is likely to be most successful. This national screening program invites women in the target age group to have free breast x-ray screening (mammography) at two-yearly intervals. Under a recent Commonwealth Project Agreement, the BreastScreen Australia Program has expanded the target age range from women aged 50–69 years to those aged 50–74 years. While mammography has been found to be the most effective with women in this age group, women aged 40–49 and 75 years or older are also eligible to participate in the program.

During the two-year period from 1 January 2011 to 31 December 2012, 54.5% of eligible Victorian women participated in the BreastScreen Australia Program in Victoria. This constitutes a decline from around 59% between 2000–2001 and 2003–04. As the population ages, the number of women in the then target age group of 50–69 years has been increasing (DHHS, 2014, p147)

For both reporting periods (2010-2012 and 2013-2015) there were higher rates of breast cancer screening participation in the Mildura LGA (55.6% and 58.5% respectively) than at the Victorian level (52.0% and 54.6% respectively). However there was a decline in screening participation for the Mildura LGA between 2010-2012 and 2013-2015 with participation rates falling from 58.5% to 55.6%.

#### Percentage of breast cancer screening participation, 2013-2015

## H.2 Percentage of cervical cancer screening participation, 2013-2014, Victorian Cervical Cytology Registry (LGA) TL

The National Cervical Screening Program promotes two-yearly screening for cervical cancer in women between the ages of 18 (or two years after first sexual intercourse, whichever is later) and 69 years. The test used in the screening program is the Papanicolaou test (Pap test or Pap smear). The aim of the program is to find cervical cancer in its early stages, or to find changes in the body that indicate the disease is likely to develop in the future. Early detection of the disease increases the chance of successful treatment.

Over the past 20 years there has been a significant decline in the incidence and mortality of cervical cancer in Victorian women. In 2013 the age-standardised incidence rate of cervical cancer in Victoria was 4.3 per 100,000 women and the mortality rate was 1.0 per 100,000 women (Cancer Council Victoria 2014).

In 2012, 78% of the 213 Victorian women diagnosed with cervical cancer had either never been screened (47%) or were lapsed screeners (last cervical screen greater than 2.5 years prior to diagnosis, 31%) (VCCR 2014).

The estimated two-year (2012–2013) participation rate for women in the target population of 20–69 years in Victoria was 60.4%, which is a slight increase from 60.0% for the previous reporting period (2011–2012). Participation in 2012–2013 varied by age group, with women aged 50–59 years having the highest two-year screening rate and women aged 20–29 years having the lowest rate. Participation rates in Victoria in 2012–2013 also varied by Department of Health and Human Services region of residence. These ranged from a low of 56.9% in the Northern and Western Metropolitan Region to a high of 63.7% in the Loddon Mallee Region (DHHS, 2014, p153).

For the 2013-2014 reporting period the Mildura LGA had a participation rate of 60.1%, above the Victorian participation rate of 59.2%.

## H.3 Percentage of bowel cancer screening participation, 2013, Department of Health and Human Services (LGA) TL / R

The National Bowel Cancer Screening Program (NBCSP) aims to reduce incidence and mortality from bowel cancer through screening to detect signs of bowel cancer through the faecal occult blood test (FOBT). In 2013, bowel (colon and rectum) cancer was the third most common new cancer (12% of all cancers) in Victorians. Bowel cancer can be treated successfully if detected in the early stages when it is still localised within the bowel. It is estimated that less than 40% of bowel cancers are detected early.

Eligible invitees for the NBCSP are sent an FOBT kit to complete and send back to a pathology lab for analysis. The NBCSP has been phased in gradually. In 2012–13, 232,439 Victorians aged 50, 55 and 65 years were invited to participate in the program, of which 79,015 (34%) completed the FOBT kit (36,395 men and 42,620 women) (DHHS, 2014, p149).

For the 2013-2014 reporting period the Mildura LGA had a bowel cancer screening participation rate of 34.5%, below the Victorian participation rate of 36.5%, seeing them ranked 62<sup>nd</sup> out of the 79 Victorian LGAs.

H.8 715 (MBS) Aboriginal Health Checks, <http://www.aihw.gov.au/indigenous-australians/indigenous-health-check-data-tool/>

All Aboriginal and Torres Strait Islander people, regardless of age, are eligible for an annual Indigenous-specific health check. This health check, listed as item 715 on the Medicare Benefits Schedule (MBS), was designed especially for Indigenous people. It was established because Indigenous people have considerably higher morbidity and mortality levels than non-Indigenous people, with earlier onset and more severe disease progression for many chronic diseases. The aim of the health checks is to provide Indigenous people primary health care matched to their needs by supporting early detection, diagnosis and intervention for common and treatable conditions.

Ensuring access to the health check is an important part of the Australian Government's commitments to *Closing the Gap* in both life expectancy and mortality. Use of health checks has increased substantially over time; nonetheless, at the national level only about 1 in 5 Indigenous people had such a health check in 2013–14.

The requirements of a health check, which are set out in the relevant section of the MBS, include core elements (for example an assessment of the patient's health, including their physical, psychological and social wellbeing) and specific elements for different age groups. There are proformas for children (0–14), adults (15–54) and older persons (+55) health checks. The check also assesses what preventive health care, education and other help should be offered to the patient to improve their health and wellbeing. Health checks can be provided by any Medicare-billing GP—including those in mainstream practices and those providing services mainly for Indigenous people—and should generally be provided by the patient's usual doctor.

The outcome of a health check may include access to other Indigenous-specific health measures. For example, if a GP identifies a need for follow-up care during a health check, they can give Indigenous people access to MBS-rebated follow up services from allied health workers, practice nurses and Aboriginal health workers.

The Australian Institute of Health and Welfare provides an online Indigenous health check (MBS 715) data tool. This tool shows numbers and usage rates of the checks at various geographic areas (including national, state and territory, Primary Health Network and Medicare Local levels). Charts and tables in the tool can be customised to show different time periods and, where possible, disaggregations by age and sex. For the purposes of this report the tool has been used to present MBS715 usage data\* for the Lower Murray Medicare Local\*\* area (because it offers the closest approximation to the Mildura LGA).

Review of the MBS715 health checks for the period 2011-12 though to 2013-14 revealed that Lower Murray Medicare Local was, in each financial year documented, performing a greater number of actual checks than any of its Victorian Medicare Local counterparts. It was also performing the proportionally highest number of checks (usage rate) in the 2013-14 financial year and had the second highest 'usage rates' in both the 2011-12 and 2012-2013 financial years.

\*Data on the number of health checks shown in this tool are the number of checks billed to Medicare in the relevant period, not the number of people who received a health check. That is, available data do not distinguish between a person receiving two health checks in one 12-month period and two different people receiving a health check in the same period. However, given these health checks are generally provided on an annual basis (although the minimum time allowed between checks is 9 months), the number of checks in a 12-month period is likely to be similar to the number of people receiving the checks. <http://www.aihw.gov.au/indigenous-australians/indigenous-health-check-data-tool/#t7> Accessed 22/04/2017.

\*\*Medicare Locals evolved from the *Divisions of General Practice Program* and were a key feature of the Australian Government's National Health Reform. Medicare Locals were primary health care organisations established to coordinate primary health care delivery, address local health care priorities, support health professionals and improve access to primary care. There were a total of 61 Medicare Locals operational across Australia. From 1 July 2015, Medicare Locals were replaced with Primary Health Networks (PHNs). The Lower Murray Medicare Local was one of 17 Medicare Locals covering Victoria (and part of NSW).

Number of MBS item 715 health checks billed to Medicare through Victorian Medicare Locals, 2011-12 – 2013-14

## Domain 1: Victorians are healthy and well

### Outcome 1.1: Victorians have good physical health

#### *INDICATOR – Increase self-rated health*

Self-rated health is a validated measure of health status. Personal perception of physical and mental health has been shown to be a powerful, independent predictor of actual health across many populations irrespective of age, sex, illness, disability, personality and social support. Self-rated health is a reliable predictor of ill-health, future healthcare use and premature mortality, independent of other medical, behavioural or psychosocial risk factors (DHHS, 2017a).

Within the Victorian Population Health Survey respondents were asked to rank their current health status by indicating whether, in general, they would say their health was excellent, very good, good, fair or poor. At the Victorian level there was no significant difference reported between the sexes.

The measures below, drawing on the 2014 and 2011 Victorian Population Health Survey results, report 'very good or excellent' self-rated health and 'fair or poor' self-rated health respectively.

The 2014 VPHS results indicate that a lesser proportion of the Mildura LGA population rate their health as 'very good or excellent' 35.4% compared to 40.2% at the Victorian level. These less positive results are a contrast to the 2011 VPHS results which indicate a lesser proportion of the Mildura LGA population rate their health as 'fair or poor' 13.4% compared to 15.9% at the Victorian level – revealing as many as 86.6% may perceive their health to be excellent, very good or good (not withstanding non-response).

#### 1.35 **1.1.4.1.A** Proportion of adults who self-rate their health as very good or excellent, 2014, Victorian Population Health Survey DHHS

## Domain 1: Victorians are healthy and well

### Outcome 1.1: Victorians have good physical health

#### *INDICATOR – Decrease unintentional injury*

*“20% of the national self-harm burden, 14% of the interpersonal violence burden and 7.5% of the unintentional injury burden (other than road transport) is due to alcohol use” (DHHS, 2015).*

#### 1.40 Unintentional injuries treated in hospital per 1,000 population, 2014, Victorian Admitted Episodes Dataset (VAED) and Victorian Emergency Minimum Dataset (VEMD) (LGA) TL / R

Unintentional injuries are those where the injury is not sustained on purpose and there is no intent to harm. This measure reflects the rate per 1,000 population of unintentional injuries treated in hospital, which includes both emergency department presentations and hospital admissions. An injury emergency department presentation is defined as an injury or poisoning that results in a person presenting to a hospital emergency department for treatment and who is triaged (assessed for urgency), including those patients who leave before treatment commences. An injury hospital admission is defined as an injury or poisoning which results in the person being admitted to a hospital bed and being discharged alive after one or more night's stay.

Data from the Victorian Admitted Episodes Dataset (2014-2015) and Victorian Emergency Minimum Dataset (2014) was collated and analysed by the Victorian Injury Surveillance Unit (VISU) to reveal a pattern of consistently higher (and worsening) unintentional injuries treated in hospital for the Mildura LGA for the 2012-2013 and 2014-2015 time periods. Most recently Mildura LGA is ranked 10<sup>th</sup> of 79 LGAs for unintentional injuries treated in hospital.

#### 1.41 1.1.5.1.A Deaths due to road traffic crashes, Road Crash Information System VicRoads

Road safety improves the safety of individuals, communities and can reduce the long-term costs to the health and social care systems, as well as to the wider economy (DHHS, 2017a).

Avoidable deaths from transport accidents, persons aged 0 to 74 years (per 100,000), 2010-2014, Public Health Information Development Unit (2017) (LGA) TL

Analysis by the Public Health Information Development Unit of 'avoidable deaths from transport accidents' per 100,000 reveals the Mildura LGA is above the Victorian rate with 6.8 deaths per 100,000 compared to 4.4 deaths per 100,000. The rate for Mildura LGA has experienced a slight decline between the 2009-2013 and 2010-2014 reporting periods.

1.43 **Road Fatalities by sex and age, July 2012 to July 2017, Transport Accident Commission (LGA) TL**

Over the period July 2012 to July 2017, 17 people died as a result of a road accident that occurred in Mildura LGA (note all road accident data present here is based on the location of the road accident). Females made up 52.9% of these deaths and this figure was much higher than both regional Victoria (31.7%) and Victoria (29.0%) averages.

Compared to regional Victoria (29.7%) and Victoria (30.9%), persons aged 21 to 39 years made up a substantially larger proportion (47.0%) of all car accident deaths that occurred in Mildura LGA. Mildura LGA also had a notably greater proportion of deaths that were of persons aged 60 - 69 years.

#### Road Fatalities by sex and age, July 2012 to July 2017

	Mildura LGA		Regional Victoria		Victoria

#### 1.45 Road accident serious injuries by sex and age, Dec. 2011 to Dec. 2016, Transport Accident Commission (LGA) TL

Over the period December 2011 to December 2016, 175 people were hospitalised for injuries from road accidents that occurred in Mildura LGA. Males made up 68.0% of hospitalisations and this proportion was much higher than the Victorian average (57.1%). Compared to Victoria (22.8%) there was a slightly higher proportion of Mildura LGA hospitalisations in the 60 years and over age group (24.6%).

##### Road accident serious injuries by sex and age, Dec. 2011 to Dec. 2016

	Mildura LGA		Regional Victoria		Victoria

#### 1.47 Percentage of unintentional injuries due to falls, 2014-2015, Victorian Admitted Episodes Dataset (VAED) and Victorian Emergency Minimum Dataset (VEMD) (LGA) TL / R

The definition of falls includes same level falls, such as slips and trips; and different level falls, for example, involving stairs, ladders or playground equipment. Falls and fall-related injury contributes a significant proportion of the burden and impact of injury in Australia.

Across all age cohorts the 'percentage of unintentional injuries due to falls' is lower for the Mildura LGA than at the Victorian level (33.6% and 38.7% respectively), with the Mildura LGA ranked 64<sup>th</sup> of 79 Victorian LGAs for this measure.

##### Percentage of unintentional injuries due to falls, 2014-2015

Mildura 33.6%

Victoria 38.7%

Rank 64

Time Trend – increasing proportion of unintentional injuries due to falls occurring across the Mildura LGA for the reporting period ↑

Mildura 32.1%

Victoria 37.3%

Rank 63

#### 1.48 1.1.5.2 Hospitalisation rate due to falls (per 100,000) in adults 65 years and older, 2011/12 to 2013/14, Victorian Admitted Episodes Database (VAED) DHHS (LGA)

Across Victoria falls are the largest cause of emergency hospital admissions for older people, and have a significant impact on long term health and wellbeing outcomes. Falls can be a major reason older people are required to move from their own home to long term nursing or residential aged care (DHHS, 2017a).

Over the period 2011/12 to 2013/14, the rate of hospitalisations for injuries caused by falls per Mildura LGA population (623.8) was lower than the Victoria average (817.0).

Of the hospitalised Mildura LGA residents:

- Persons aged 65 years and over made up the greatest *proportion* (58.9%) of all hospitalisations and this proportion was similar to (though less than) the state average (59.1%)
- Children aged 0 to 14 years made up 15.4% of hospitalisations and this proportion was higher than the Victoria average (12.4%)
- The rates of falls-related hospitalisations per age group, including for persons aged 65 years and over, were lower than state averages for each age group, and
- Falls accounted for 43.2% of all accidental injury (unintentional harm) hospitalisations of Mildura LGA residents. This proportion was similar to the regional Victoria average (43.0%) and slightly lower than the Victoria average (45.1%).

1.54 **Health** Childhood accidents, Rate of Childhood Hospital Admissions (per 1,000 children aged 0-19 years), 2015 [previously Rate of Childhood Accidents (per 1,000 children)] (*Section 4.1 2012 Social Indicators Report*)

Injuries are a major cause of premature mortality for children and young people in Victoria. The burden of premature death due to injury is far greater than the non-fatal burden for this age group. However, injuries do cause significant morbidity for children and young people and are a leading cause of hospitalisation and treatment within a general practice or other primary care setting (DHHS, 2017a).

Data for this measure, as presented in the *2012 Social Indicators Report*, was provided by Monash University. The Victorian Injury Surveillance Unit (VISU) at Monash University was again commissioned to provide updated data for this measure for presentation in the State of Mildura Rural City Report. Through the process of commissioning more recent data Monash recommended two changes to the measure's presentation: firstly, the age cohort was not specified in the *2012 Social Indicators Report* and needed to be clarified to enable ongoing comparison of data sets, and secondly when current data was collated at postcode level (even for the broadest possible age cohort, 0-19 years) the numbers were found to be too small to break down by year for some of the locations. As a result, on Monash University's recommendation, data was re-commissioned to include clear age cohort (0-19 years) at the larger SA2 geographic level. Tables were also developed retrospectively according to these parameters as far back as 2011 (when the ABS commenced presenting Mildura LGA data at the SA2 level). Finally, Monash University recommended the measure be renamed to 'Rate of Childhood Hospital Admissions' to better reflect the actual measure (the 'rate of childhood accidents' terminology was misleading in that many accidents occur which do not present at hospital and are therefore not counted).

The table presented below reflects these changes and is the suggested model for reporting data for this measure into the future.

Critically through the review of the *2012 Social Indicators Report* Monash University also questioned the accuracy of the methodology of reported data for Rate of Childhood Accidents. Readers will note that the 2011 overlap between this current report and the *2012 Social Indicators Report* reveals significantly different rates for the Mildura LGA and Regional Victoria. Time trend data in this report draws only on the data commissioned specifically for this report. Significantly, the Mildura LGA sits below the 'rest of regional Victoria' and 'Metro Melbourne' rates of childhood hospital admissions for each of the five documented years (2011-2015).

Rate of childhood hospital admissions  
(per 1,000 children aged 0-19 years) for the Mildura LGA, 2011-2015

Source: Victorian Injury Surveillance Unit (VISU) at Monash University, 2017

\* VAED data for the period January 2011 - December 2015 was analysed for this report. VAED data for this period is coded to the International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modifications (ICD-10-AM). The section, or chapter, of the ICD that describes the circumstances of the injury is called the External Causes of Morbidity and Mortality chapter. Transport injuries are mainly selected based on these codes.

\* In July 2012 the Victorian Hospital Admission Policy changed significantly meaning that patients who received their entire care within a designated emergency department or urgent care centre could no longer be eligible for admission regardless of the amount of time spent in the hospital. This has had the effect of reducing the number of admissions recorded on the VAED for the 2012/13 financial year. For this reason VISU has made an adjustment by excluding those cases in the VAED that were treated within the ED during the entire episode for records pre 2012/13 as well as some residual cases post 12/13.

**Selection criteria:**

- Calendar year of admission = 2011-2015
- VAED records were initially extracted if the principal diagnosis was a community injury (S00-T75 or T79 ICD 10 AM code) and the 'human intent' was recorded as unintentional.
- Admissions as a result of transfer from another hospital or due to a statistical separation from the same hospital have been excluded.
- Readmissions for day-treatments (e.g., hyperbaric chamber treatment, blood transfusions etc.) within 30 days of initial admission were excluded.
- Population figures by LGA & Statistical Area 2 (SA2) were obtained from ABS cat. No. 3235.0 Population by age and sex, regions of Australia, 2011-2015 (using population estimates for June of each year).

**1.55 Happy and Healthy** Children have a healthy childhood, Rate of Childhood Hospital Admissions (per 1,000 children aged 0-19 years), 2015 [previously Rate of Childhood Accidents (per 1,000 Children)]

Data for this measure, as presented in the *2014 State of Mildura Rural City's Children and Young People Report*, was drawn from the *2012 Social Indicators Report* based on data provided by Monash University. As noted above changes were made to this measure based on recommendations from Monash University.

The *State of Victoria's Children 2010* report noted that the rates and types of accidents and injuries to children vary across the lifespan. For children in infancy, a time of high dependence, injuries tend to stem from abuse or neglect. Between the ages of 1 to 4, the child begins to be mobile but lacks an understanding of, or ability to recognise, hazards and risks, leading to injuries relating to pharmaceutical poisonings, fire and drowning. In middle childhood (from 5 to 9 years), where the child explores the world through play and schooling, the characteristic injuries are falls (e.g. from playground equipment). DEECD data shows that the death rate for unintentional injuries for Victorian children aged 0 to 17 years has declined over the past decade (DEECD, 2013).

Rate of Childhood Hospital Admissions (per 1,000 children aged 0-19 years), 2015

Mildura 9.96

Regional Victoria 13.43

Time Trend – Rate of Hospital Admissions (per 1,000 children aged 0-19 years) increasing between 2011\* and 2015 yet remaining below the Regional Victoria rate ↑

Rate of Childhood Hospital Admissions (per 1,000 children aged 0-19 years), 2011

Mildura 7.49

Regional Victoria 12.74

\* by contrast the data for this measure as presented in the *2014 State of Mildura Rural City's Children and Young People Report* suggested the following Rates of Childhood Accidents (per 1,000). On advice from Monash University this data is now considered inaccurate.

Mildura 160.9

1.58 **Happy and Healthy** Children have a healthy childhood, Total Hospital Separations, per 10,000 children aged 0 to 9 years, 2013–2016 – Chapter XXI Factors (i.e. factors influencing health status), Victorian Admitted Episodes Dataset (VAED) (LGA) TL

Over the 2013-16 period, the most common causes\* for hospital admission of Mildura LGA children aged 0-9 years were:

- certain conditions originating in the perinatal period (427.8)
- diseases of the respiratory system (294.8), and
- diseases of the digestive system (198.2).

*\* Based on ICD chapters and excludes 'undefined' and 'factors influencing health status and contact with health services' categories.*

Over the 2013-16 period, compared to Regional Victoria averages, Mildura LGA children aged 0-9 years were much more likely to be admitted to hospital for the following causes (ranked by greatest difference):

- diseases of the blood & blood-forming organs & certain disorders involving the immune mechanism
- neoplasms
- diseases of the digestive system
- diseases of the genitourinary system
- diseases of the skin and subcutaneous tissue, and
- diseases of the eye and adnexa.

Between 2005-08 and 2013-16, the rate of hospital admissions of Mildura LGA children aged 0 - 9 years increased notably for the following causes (ranked by greatest difference):

- diseases of the nervous system
- neoplasms
- diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism
- diseases of the musculoskeletal system and connective tissue
- certain conditions originating in the perinatal period
- mental and behavioural disorders<sup>#</sup>
- endocrine nutritional and metabolic diseases
- symptoms signs and abnormal clinical laboratory findings NEC\*\*
- diseases of the genitourinary system
- congenital malformations deformations and chromosomal abnormalities, and
- injury poisoning and certain other consequences of external causes.

<sup>#</sup> Cause had a very low count and should be interpreted with caution

#### 1.62 Workplace injury claims - by industry sector, 2008 – 2014, WorkSafe Victoria (LGA) TL

Between 2008 and 2014, there were 1,362 Workcover claims for workplace injuries that occurred at workplaces registered in Mildura LGA. The health care and social assistance sector and manufacturing sector were the most common industry sectors for which injury claims were made.

Compared to state averages, workplaces registered in Mildura LGA had a notably greater proportion of injury claims in the following sectors:

- agriculture, forestry and fishing
- electricity, gas, water and waste services, and
- transport, postal and warehousing.

Note that LGA figures are based on the registered address of the employer and not the residence of the worker who has made the injury claim.

#### Workplace injury claims - by industry sector, 2008 – 2014

#### Health Occupational accidents, Rate of Farm Accidents, 2006-2011 (Per 1,000 Persons in the Farm Labour Force) *(Section 4.4 2012 Social Indicators Report)*

Data was re-commissioned from Victorian Injury Surveillance Unit (VISU) at Monash University to resolve methodology issues highlighted with the *2012 Social Indicators Report* (specifically the concern that all accidents, to all ages, occurring on a farm were being called farm accidents yet using only 'farm labour force' as the denominator). This methodology failed to recognise that some accidents were not related to farming at all, for example a young child hurting themselves playing at home. The Victorian Injury Surveillance Unit (VISU) at Monash University developed tables retrospectively (back to 2006), according to their suggested methodology (rate of injuries occurring on farms to people aged 20 years and older, as a proportion of the entire population aged 20 years and older) to minimise this issue. This data is presented below.

#### 1.67 Hospitalisations<sup>#</sup> for injuries that occurred on a farm (rate per 100,000), 2011/12 to 2013/14, Victorian Injury Surveillance Unit (LGA) TL

Over the period 2011/12 to 2013/14, there were 21 hospitalisations of Mildura LGA residents for injuries that occurred on a farm setting. The rate of hospitalisations per Mildura LGA 2012 population (13.4) was lower than Regional Victoria average rate (19.6) but higher than the Victoria average rate (6.6).

#### Hospitalisations<sup>#</sup> for injuries that occurred on a farm (rate per 100,000), 2011/12 to 2013/14

Location	No.	2012 ERP	Rate*
Mildura LGA	21	52,204	13.4
Regional Victoria	847	1,442,366	19.6
Victoria**	1,112	5,628,348	6.6

Numbers provided by Victorian Injury Surveillance Unit (VISU), Monash University Injury Research Institute, commissioned data 2015.

Rates prepared by Nancy Vaughan Writing and Research \* Average annual rate per 100,000 2012 Estimated Resident Population (ERP) June 2012. Note that rates are not standardised.

#Does not include persons who were treated in an emergency department and not admitted into hospital

\*\*Total excludes unincorporated Victoria and interstate/unknown residence.

# 1.68 Hospitalisations<sup>#</sup> for injuries that occurred on a farm - by sex, 2011/12 to 2013/14, Victorian Injury Surveillance Unit (LGA) TL

In review of data pertaining to injuries that occurred on a farm males accounted for 66.7% of hospitalisations, while females accounted for 33.3%. Compared to the Victoria average, Mildura LGA had a slightly greater proportion of female hospitalisations.

## Hospitalisations<sup>#</sup> for injuries that occurred on a farm - by sex, 2011/12 to 2013/14

Location	Total	Male		Female	
	No.	No.	%	No.	%

## Domain 1: Victorians are healthy and well

### Outcome 1.1: Victorians have good physical health

#### INDICATOR – Increase oral health

1.69 **1.1.6.1** Rate of potentially preventable dental hospitalisations of children 0–9 years, 2014/2015, Victorian Health Information Surveillance System (LGA) TL

A potentially preventable hospitalisation is an:

*"Admission to hospital for a condition where the hospitalisation could have potentially been prevented through the provision of appropriate individualised preventative health interventions and early disease management usually delivered in primary care and community-based care settings (including by general practitioners, medical specialists, dentists, nurses and allied health professionals)." (National Healthcare Agreement: PI 18-Selected potentially preventable hospitalisations, 2015)*

In 2014/15, there were 252 potentially preventable hospitalisations of Mildura LGA residents for dental conditions. The rate of hospitalisations for Mildura LGA residents (4.7) was higher than the regional Victoria (3.1) and Victoria average (2.7). Hospitalisation rates were also higher than regional Victoria and Victoria rates in each age cohort. Children aged 0 - 9 years (10.6) had the highest rate of hospitalisations out of all age cohorts.

Rate (per 1,000) of potentially preventable dental hospitalisations of children 0–9 years, 2014/2015

## Domain 1: Victorians are healthy and well

### Outcome 1.1: Victorians have good physical health

#### INDICATOR – Increase sexual and reproductive health

Sexual health is an important element of health and wellbeing. Sexual health requires respect, safety and freedom from discrimination and violence; it is influenced by gender norms and power dynamics; and is expressed through diverse sexualities.

Sexually transmissible infections (STI) and blood borne viruses (BBV) place a significant burden on the Victorian community. Syphilis is a notifiable disease in Victoria. Infectious syphilis notifications in Victoria rose 70-fold from nine cases in 2000 to 629 cases in 2014. Syphilis notifications are at their highest levels since the condition became notifiable in 1991 (DHHS, 2014, p142).

#### 1.75 1.1.7.1 Notified cases of AIDS\* (2014-2016), National Notifiable Disease Surveillance System (NNDSS) DHHS (Loddon Mallee Region)

HIV is preventable, with advances in prevention, testing and treatment providing great potential to significantly reduce new infections and improve health and wellbeing outcomes for those with HIV. Newly acquired HIV infection provides a measure of recent transmission (DHHS, 2017a).

#### 1.77 Notifications of Chlamydia per 100,000 population, 2014, Victorian Notifiable Infectious Diseases Surveillance database (NIDS), Department of Health and Human Services (LGA) TL / R

Chlamydia is a bacterial sexually transmissible infection caused by *Chlamydia trachomatis*. Chlamydia is the most commonly notified curable sexually transmitted infection (STI) in Victoria and the most commonly reported notifiable disease in Australia. Most chlamydia infections are asymptomatic. Chlamydia infection has become a major public health problem because of the associated long-term consequences of untreated infection, in particular pelvic inflammatory disease in women, and infertility in women and men (DHHS, 2017a).

The data reported below relate to notifications of Chlamydia received by the Department of Health and Human Services and do not necessarily reflect the true incidence of the disease. In Victoria, laboratories and medical practitioners are required to notify cases to the department in writing within five days of diagnosis. Data are presented by residential location and so do not necessarily indicate where the infection was acquired.

Data for the 2014 reporting period reveals higher rates of notifications of Chlamydia for the Mildura LGA (362.5 per 100,000) compared to their Victorian counterparts (330.7 per 100,000) according the Mildura LGA a rank of 15 from 79 Victorian LGAs.

1.78 Annual Totals (and rate per 100,000#), gonococcal infection, 2016/2017, Surveillance\* of notifiable conditions in Victoria

Gonorrhoea is a common curable STI caused by the bacteria *Neisseria gonorrhoeae*, which can be transmitted through vaginal, oral or anal sex. Gonorrhoea affects both men and women, but in Victoria is an infection primarily of men who have sex with men. Notifications have increased over the past five years among both men and women in all age groups. Untreated gonococcal infection can lead to serious health consequences including pelvic inflammatory disease and infertility in women, testicular infection in men and can increase the risk of HIV transmission (DHHS, 2017a).

Data provided by the Department of Health captured through the Surveillance of Notifiable Conditions reveals the Mildura LGA has a significantly lower rate of notifications for gonococcal infection (11.6 per 100,000) compared to their Victorian counterparts (124.2 per 100,000). Comparison with 2014 data reveals an almost doubling of actual notification numbers for Victoria between 2014 and 2016 with a slight decline in notification numbers over the same time period for the Mildura LGA.

Annual Totals (and rate per 100,000#), gonococcal infection, 2016/2017

Mildura 7 (11.6)

Victoria 6261 (124.2)

1.79 **1.1.7.4** Proportion of sexually active young people who always use a condom, 2014, Healthy Behaviour in School-aged Children (HBSC) survey, About You DET (Mallee Region only) TL

Safe sex is sexual contact where both parties are protected against sexually transmissible infections (STIs) and unplanned pregnancy. Unsafe sex may put people at risk of STIs such as chlamydia, gonorrhoea, syphilis, HIV or hepatitis B, or may result in an unplanned pregnancy (DHHS, 2017a).

Data drawn from the Department of Education and Training's 2014 About You Survey indicates the Mallee Area has a significantly higher proportion of sexually active young people who always use a condom (47.1%) compared to their Victorian counterparts (27.0%).

Rate of live births to women aged 15 to 19 yrs in the calendar year (per 1,000 women in this age group), 2008 to 2012

Source: Perinatal Data Collection

Methodology: Numerator - Number of live births to women aged under 19 years in the calendar year / Denominator - The female estimated resident population aged 15-19 at 30 June

Note: the teenage fertility rate for girls under the age of 15 years is not reported because it is unstable due to both its low numbers and being not routinely collected.

<http://www.education.vic.gov.au/about/research/Pages/vcamstableau.aspx> Accessed 15/05/2017

### 1.83 Engaged, Learning, Achieving Teenage Fertility Rate, Rate of live births to women aged 15-19 years (per 1,000 women in this age group), 2013-2015, Victorian Perinatal Data Collection DHHS (LGA) TL

Parenthood in the teenage years can result in interrupted (and lower rates of participation in) education, greater dependence on government assistance, increased problems entering the labour market and marital instability. However, the social and economic disadvantage that teenage parents and their babies experience may at least partly be a reflection of the circumstances before the pregnancy and birth. Indigenous women, women from areas of low socioeconomic status, and women with lower educational qualifications, all have higher fertility rates than the general female population. Teenage females who lived in remote and very remote areas were more than 5 times as likely to give birth as their peers in major cities (62 births per 1,000 compared with 12 births per 1,000). At the national level 20% of Indigenous mothers were teenagers, compared with 3% of non-Indigenous mothers (State of Mildura Rural City's Children and Young People Report, 2014).

##### Total fertility rate (per 1,000)\*, 2011

Mildura 2.22

Victoria 1.79

\* This entry gives a figure for the average number of children that would be born per woman if all women lived to the end of their childbearing years and bore children according to a given fertility rate at each age. The total fertility rate (TFR) is a more direct measure of the level of fertility than the crude birth rate, since it refers to births per woman. This indicator shows the potential for population change in the country. A rate of two children per woman is considered the replacement rate for a population, resulting in relative stability in terms of total numbers. Rates above two children indicate populations growing in size and whose median age is declining.

## Domain 1: Victorians are healthy and well

### Outcome 1.2: Victorians have good health

#### *INDICATOR - Increase mental wellbeing*

##### 1.86 Subjective Wellbeing (range 0-100), 2015 VicHealth Indicators Survey (LGA) TL

Our individual responses to life challenges, transitions and disruptions are shaped by our physical, psychological and social capacity to adapt and restore to a balanced state of wellbeing. Subjective wellbeing refers to individuals' perceptions of the quality of their lives, however lifestyle factors and demographic circumstances also have predictive influences. For example, people who find a good work-life balance and stay healthy by eating well and exercising regularly generally report higher levels of wellbeing. Conversely, people living in rental accommodation, remote regions and areas with high cost of living, long commute times and a high population density generally report lower levels of subjective wellbeing.

Subjective wellbeing considers an individual's experience of their life, as well as a comparison of their life circumstances with social norms and values. The International Wellbeing Group (IWBG) identify seven dimensions of life that contribute to subjective wellbeing: standard of living, health, achieving in life, relationships, safety, community, and future security. These domains highlight social connections (personal and community), economic considerations and a sense of purpose as core elements of overall life satisfaction (VicHealth 2016).

Measures draw from the VicHealth Indicators Survey reveals, for both the 2015 and 2011 survey periods, that the Mildura LGA experiences slightly higher levels of subjective well-being than their Victorian counterparts. There was a slight decline in the level of subjective well-being reported by Mildura LGA residents between 2011 and 2015.

##### Subjective Wellbeing (range 0-100), 2015

### 1.87 Resilience (range 0-8), 2015 VicHealth Indicators Survey (LGA) TL

Resilience is a fundamental component of mental wellbeing that enables people to cope with adversity and to reach their full potential. It is described as a person's capacity to successfully overcome significant challenges or negative outcomes and restore their previous level of function, thus avoiding mental ill-health. It is generally believed that resilience develops over time, and is important because it provides people with the resources to handle the stresses involved in life transitions and builds the capacity of those at risk of mental illness to better manage it. Resilience is a dynamic quality that evolves through the interaction between people, families, communities and their environment. The presence of resilience in high levels is associated with a lower risk of mental health problems and higher levels of mental wellbeing.

Factors that have been shown to facilitate resilience at the individual level include temperament, self-esteem, self-efficacy, confidence, social skills, emotion regulation and problem solving. At the family/friends level, factors include secure attachment, family environment, quality of parenting, safety and economic security, and respectful relationships, among others. At the broader community and organisation level, factors include connections to clubs, schools and religious groups, opportunities for social and economic participation, and safe, cohesive and connected communities (VicHealth 2016).

Data draw from the 2015 VicHealth Indicators Survey reveals the Mildura LGA experiences slightly higher levels of resilience, along a range of 0-8, than their Victorian counterparts (6.5 and 6.4 respectively).

### 1.88 1.2.1.1.A Proportion of adults who report high or very high psychological distress, 2014, Victorian Population Health Survey DHHS (LGA) TL

**Happy and Healthy** Adolescents have good mental health, Proportion of population experiencing 'high' to 'very high' levels of psychological distress, 2014, *Victorian Population Health Survey, Department of Health (LGA) TL*

Good mental health is fundamental to the wellbeing of individuals, their families and the population as a whole. Mental health problems and mental illness are major causes of poor health in Victoria. Mental disorders including anxiety, depression, and substance misuse, are estimated to affect almost half of Australians aged 16–85 during their lifetime. Mental health problems and mental illness include a range of cognitive, emotional and behavioural disorders (DHHS, 2017a).

Psychological distress is an important risk factor for a number of diseases and conditions including fatigue, migraine, cardiovascular disease, chronic obstructive pulmonary disease, cerebrovascular disease, injury, obesity, depression and anxiety. It is also a significant risk factor for risky drinking, smoking and drug use. The Kessler 10 Psychological Distress Scale (K10) has been validated as a screening tool for detecting affective disorders such as depression and anxiety, is currently in use in general practice in Australia and as such is the tool included in the VPHS. The K10 categorises the level of psychological distress over a four-week period and covers the dimensions of nervousness, hopelessness, restlessness, sadness and worthlessness. Individuals are categorised to four levels of psychological distress based on their score: low (10–15), moderate (16–21), high (22–29) and very high (30–50).

Based on the application of the K10 in the VPHS the proportion of Victorian adults with low levels of psychological distress was 61.3% (less than the Mildura LGA level of 65.2%). When the categories of 'high' and 'very high' levels of psychological distress were combined the proportion of Victorian adults was 12.6% compared to the Mildura LGA proportion of 14.0%. This was an increase from the levels reported in the 2011/2012 VPHS (12.7%).

#### 1.89 1.2.1.1.B Proportion of young people who showed high levels of psychological distress (depressive symptoms), 2014, About You DET (Mallee Region only)

Data drawn from the Department of Education and Training's 2014 About You Survey revealed, for the Mallee Area, lower proportions of 'high levels of psychological distress' (13.0%) compared to the Victorian level (15.5%).

Proportion of young people who showed high levels of psychological distress (depressive symptoms), 2014

Mallee Area 13.0%

Victoria 15.5%

Source: <http://www.education.vic.gov.au/about/research/Pages/vcamstableau.aspx> Accessed 27/04/2017

State collected and analysed data available at the local level data specific to the mental health of young people was limited.

The above measure 'Proportion of young people who showed high levels of psychological distress (depressive symptoms) (2014)' was only available at the Mallee Region level and presented positive results. Data reported following the excerpt below, which draws on headspace Mildura data, suggests less positive mental health outcomes for local youth. For example data drawn from the Department of Education and Training's School Entrant Health Questionnaire indicates a continuing and increasing trend by parents, of children at school entry, reporting high levels of family stress. In 2014 the Mildura LGA had 12.4% of parents reporting high levels of family stress (up from 11.9% in 2012) compared to 11.0% at the Victorian level.

Similarly data from HOSdata based on the Victoria Admitted Episodes Dataset suggests the 'Rate\* of Hospital Admissions for Mental and Behavioural Disorders (per 10,000), Mildura LGA Residents aged 10-19 Years, (2013-16)' was 37.7 (per 10,000) for Mildura compared to 31.3 (per 10,000) for Regional Victoria. More positively the Mildura LGA rate had declined from 54.1 (per 10,000) in 2005-08. Whilst it is always difficult to link improvements in complex social problems to single factors the advent of headspace Mildura in March 2015 may have a bearing on the reduction in hospital admissions for this age cohort.

## headspace Mildura

headspace is the National Youth Mental Health Foundation providing early intervention mental health services to 12-25 year olds, along with assistance in promoting young peoples' wellbeing. This covers four core areas: mental health, physical health, work and study support and alcohol and other drug services.

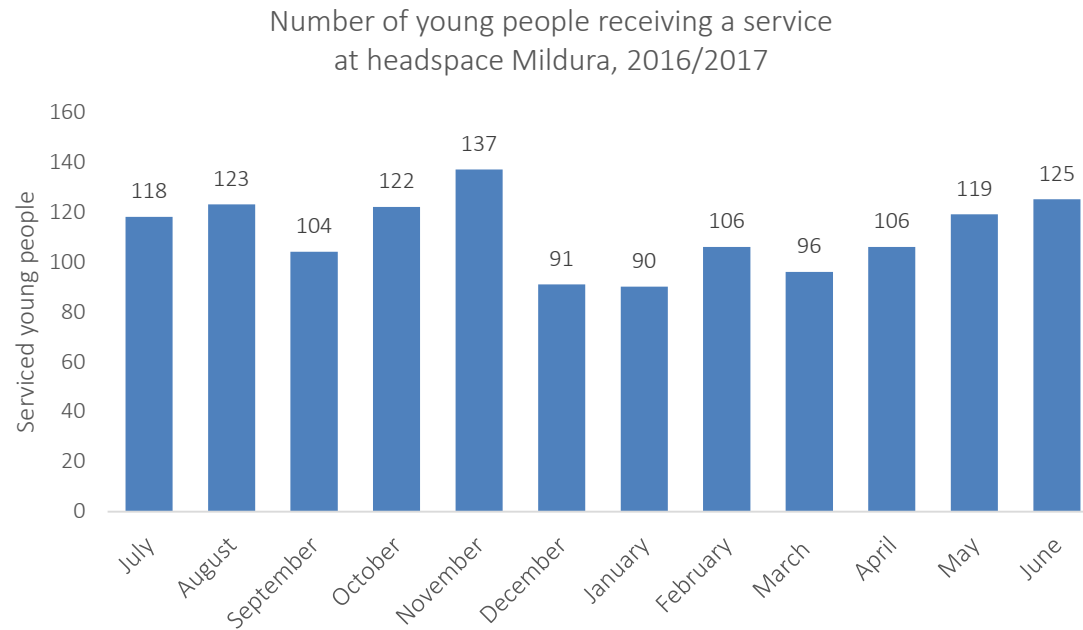

Research reveals that one in four young people have experienced a mental health issue in the past 12 months – a higher prevalence than all other age groups. Alarming, suicide is the leading cause of death of young people, accounting for one third of all deaths.

Research shows that 75% of mental health issues emerge before the age of 25. By treating these issues early and providing a holistic model of support, the risk of them developing into more serious problems is greatly decreased.

headspace centres are located across metropolitan, regional and rural areas of Australia. They are built and designed with input from young people so they don't have the same 'look or feel' as other clinical services. The centres are there to help people access health workers – whether it's a GP, psychologist, social worker, alcohol and drug worker, counsellor, vocational worker or youth worker. headspace Mildura is operated by Ramsay Health Care Pty Ltd. All headspace centres are funded by the Australian Government Department of Health. Administration of funding is carried out by the headspace centre's local Primary Health Network, in Mildura's case, Murray (Murray PHN) <https://www.headspace.org.au/about-us/who-we-are/> Accessed 15/06/2017.

Data was commissioned from headspace Mildura to add further local detail to mental health and wellbeing data measures presented at the municipal and regional levels. The following data reflects use of the headspace service in Mildura since it opened in March 2015. Importantly the figures captured do not differentiate between service users from outside the Mildura LGA so the cross-border population is considered in this data.

Number of young people receiving a service at headspace Mildura each month, 2016/2017

Source: headspace Mildura, pers. comm. Accessed July 2017

Demographic profile of serviced young people, Indigenous, March 2015 – March 2017

Source: headspace Mildura, pers. comm. Accessed May 2017

Whilst a greater proportion of 'serviced young people' at Mildura headspace identify as Indigenous (15.2%) compared to their national counterparts (7.9%) these figures are in keeping with what might be expected in light of the local demographic.

For example, drawing on 2016 Census of Population and Housing data the proportion of Mildura LGA youth aged 10-24 years who identify as Aboriginal and/or Torres Strait Islander was 6.3% (this figure does not allow for the 7.6% of 10-24 years olds for whom 'Indigenous Status' was not stated). Again drawing on 2016 Census of Population and Housing data the proportion of Australia's youth aged 10-24 years who identify as Aboriginal and/or Torres Strait Islander was 2.8% (once again this figure does not allow for the 5.5% of 10-24 years olds for whom 'Indigenous Status' was not stated). Extrapolating these figures out the rate of Indigenous youth accessing headspace Mildura is 2.4 times what might be expected based on population, whereas the rate of Indigenous youth accessing headspace services Australia wide is 2.8 times what might be expected based on population.

Source: data drawn from 2016 Census of Population and Housing Aboriginal and Torres Strait Islander Peoples Profiles for Mildura LGA and Australia [http://www.censusdata.abs.gov.au/census\\_services/getproduct/census/2016/communityprofile/](http://www.censusdata.abs.gov.au/census_services/getproduct/census/2016/communityprofile/) Accessed 20/12/2017

Demographic profile of serviced young people, Culturally or Linguistically Diverse, March 2015 – March 2017

Source: headspace Mildura, pers. comm. Accessed May 2017

No one statistic captured through the ABS Census of Population and Housing is an accurate measure of cultural or linguistic diversity, for example 'Country of Birth of Person by Age' and 'Country of Birth of Parents' could both be considered a reflection, as could 'Language Spoken at Home by Proficiency in Spoken English/Language'. For the purposes of providing a reference point as to whether the demographic profile of serviced young people – in terms of cultural or linguistic diversity – at headspace Mildura is a reflection of the broader community this report draws on Census of Population and Housing data regarding 'Country of Birth of Person by Age'.

It is also important to note that the age cohorts presented for this measure by the ABS do not reflect well the headspace client base – so the figures below should be considered as guides only.

Of the 13,539 5-24 year olds in the Mildura LGA 11,720 (86.6%) indicate their country of birth as Australia, suggesting 13.4% were born overseas. Of the 5,888,217 5-24 year olds in Australia 4,648,303 (78.9%) indicate their country of birth as Australia, suggesting 21.1% were born overseas. Across the Mildura LGA approximately 36.6% of 5-24 year olds who were born overseas were potentially accessing headspace Mildura. In comparison, using the equivalent National level data 44.5% of 5-24 year olds who

were born overseas were potentially accessing headspace services throughout Australia. However, and as mentioned earlier, using 'Country of Birth of Person by Age' alone as an indicator is a crude system.

Source: data drawn from 2016 Census of Population and Housing General Community Profiles for Mildura LGA and Australia  
[http://www.censusdata.abs.gov.au/census\\_services/getproduct/census/2016/communityprofile/](http://www.censusdata.abs.gov.au/census_services/getproduct/census/2016/communityprofile/) Accessed 20/12/2017

Demographic profile of serviced young people, Lesbian, Gay, Bisexual, Trans, Intersex, Questioning, March 2015 – March 2017

Source: headspace Mildura, pers. comm. Accessed May 2017

At this stage no ABS Census of Population and Housing data exists to provide a reference point for whether the profile of serviced young people at headspace Mildura is in fact a reflection of the proportion of the local population identifying as Lesbian, Gay, Bisexual, Trans, Intersex, Questioning.

#### 1.90 Absence of sadness, Grade 4 students, 2016, Middle Years Development Instrument (LGA)

Social and emotional competencies are critical for children's successful development throughout their lives. Social and emotional well-being is associated with greater motivation and achievement in school, as well as positive outcomes later in life including post-secondary education, employment, healthy lifestyles, and physical and psychological well-being.

The Middle Years Development Instrument (MDI) questionnaire asks children 23 questions related to their Social and Emotional Development. Three of these questions are scored together to indicate the 'Absence of Sadness' (I feel unhappy a lot of the time, I feel upset about things and I feel that I do things wrong a lot). The 'Absence of Sadness' measure provides a further layer to understanding depression amongst Mildura LGA government school students as depressive symptoms during middle childhood may be able to predict later onset of depression.

Drawing on the MDI data for Grade 4 students in the Mildura LGA reveals 13% of respondents 'agree a little' or 'agree a lot' that 'I feel unhappy a lot of the time', 'I feel upset about things' and 'I feel that I do things wrong a lot'.

*“Research shows that a single caring adult, be it a family member, a teacher or a neighbour, can make a very powerful difference in a child’s life” The Social Research Centre & Human Early Learning Partnership (2017)*

Resilience is defined as the ability to function competently in the face of challenges, adversity or stress. It includes the capacity to recover from difficulties or changes in life circumstances and to adapt and grow from disruptive experiences. Young people who are psychologically resilient are more likely to respond constructively to challenges and difficulties they face in their lives. Resilience includes autonomy (sense of personal agency), relatedness (positive connections with others) and competence (feeling capable or masterful). High levels of resilience are an important protective factor for health and wellbeing, especially during the significant transitions of adolescence and early adulthood (DHHS, 2017a).

As the Middle Years Development Instrument notes “experiences in the middle years, ages 6 to 14, have critical and long lasting effects. They are powerful predictors of adolescent adjustment and future success”. During this time, children are experiencing significant cognitive, social and emotional changes that establish their lifelong identity and set the stage for adolescence and adulthood. The overall health and well-being of children in their middle years affects their ability to concentrate and learn, develop and maintain friendships, and make thoughtful decisions. **There is mounting evidence to suggest that positive relationships with adults and peers during this critical time act to increase a child’s resiliency and success.**

#### 1.92 Positive relationships with adults and peers, Grade 4 students, 2016, Middle Years Development Instrument (LGA)

ADULTS AT SCHOOL Assesses the quality of relationships children have with the adults they interact with at school. School adults, including teachers, principals and school staff, are in a unique position to form meaningful bonds with children. Research shows that the quality of relationships children have with the adults at their school predicts their levels of anxiety and conduct challenges. Children who perceive their teachers as caring report feeling more academically and prosocially motivated.

Three questions are assessed to inform this measure “At my school there is an adult who: believes I will be a success / really cares about me / listens to me when I have something to say”. Four percent of Grade 4 students in the Mildura LGA indicated this was ‘not at all true’ for them.

Positive relationships with adults at school, Grade 4 students (not at all true), 2016  
Mildura 4%

Time Trend – not available, MDI undertaken for the first time in 2016.

ADULTS IN THE NEIGHBOURHOOD/ COMMUNITY Assesses the quality of relationships children have with the adults they interact with in their neighbourhood or community. Children who have an adult in their community to whom they look up to and spend time with report higher self-esteem and life satisfaction, feel more competent in school and are less likely to engage in risky behaviour. Supportive community adults can include coaches, religious leaders, friends’ parents and neighbours, as well as doctors or

counsellors. Children are asked to rate the following statements: “In my neighbourhood/community there is an adult who: really cares about me / believes that I will be a success / listens to me when I have something to say”. Fourteen percent of Grade 4 students in the Mildura LGA indicated this was ‘not at all true’ for them.

Positive relationships with adults in the neighbourhood/community, Grade 4 students (not at all true), 2016

Mildura 14%

Time Trend – not available, MDI undertaken for the first time in 2016.

ADULTS AT HOME Assesses the quality of relationships children have with the adults in their home. Attachment research suggests that the relationships children have with their primary caregiver(s) serve as a model for all future relationships. A healthy parent-child relationship enables children to form other healthy relationships that will serve them throughout their lives. Children are asked to rate the following statements: “In my home there is a parent or another adult who: believes I will be a success / listens to me when I have something to say / I can talk to about my problems”. Three percent of Grade 4 students in the Mildura LGA indicated this was ‘not at all true’ for them.

Positive relationships with adults at home, Grade 4 students (not at all true), 2016

Mildura 3%

Time Trend – not available, MDI undertaken for the first time in 2016.

PEER BELONGING Measures children’s feelings of belonging to a social group. Beginning in middle childhood, friendships and peer support begin to have a stronger influence on children’s school motivation, academic achievement and success. Children begin to place more importance on peer groups than on relationships to adults. During this phase of human development children need to feel they have friends they can count on.

Children absorb information from peers about how to behave, who they are and where they fit. Feeling part of a group can boost self-esteem, confidence and personal well-being. Peer relationships provide opportunities for learning cooperation, gaining support, acquiring interpersonal skills and persisting through difficulties. Children are asked the following questions: “When I am with other kids my age, I feel I belong / I feel part of a group of friends that do things together / I feel that I usually fit in with other kids around me”. Ten percent of Grade 4 students in the Mildura LGA ‘disagreed a little’ or ‘disagreed a lot’ with this statement.

Peer belonging, Grade 4 students (‘Disagree a little’ or ‘Disagree a lot’), 2016

Mildura 10%

Time Trend – not available, MDI undertaken for the first time in 2016.

#### 1.94 Well-Being Index, Grade 4 students, 2016, Middle Years Development Instrument (LGA)

The Well-Being Index combines MDI measures relating to children's physical health and social and emotional development that are of critical importance during the middle years. These are: Optimism, Happiness, Self-Esteem, Absence of Sadness and General Health. Scores from these five measures are combined and reported by three categories of well-being, providing a holistic summary of children's mental and physical health: 'Thriving,' 'Medium to High' well-being, or 'Low' well-being.

Well-Being Index, Grade 4 students (low well-being\*), 2016

#### 1.96 **1.2.1.3** Proportion of children living in families with healthy family functioning, 2013, VCHWS DET (Mallee Region only) TL

Family relationships and interactions influence childhood development. Supportive and loving family and extended family relationships, healthy family functioning and access to social and family supports all contribute strongly to children's optimal health and wellbeing (DHHS, 2017a).

The following data, a reflection of the entire Mallee Area, indicates that a higher proportion of children in the Mallee are living in families with healthy family functioning (88.9%) compared to their Victorian counterparts (87.5%).

##### Proportion of children living in families with healthy family functioning, 2013

Mallee Area 88.9%

Victoria 87.5%

Source: <http://www.education.vic.gov.au/about/research/Pages/vcamstableau.aspx> Accessed 27/04/2017

#### 1.97 **Safe and Secure** Proportion of children at school entry whose parents report high levels of family stress in the past month, 2014, School Entrant Health Questionnaire, 2014 (LGA) TL

Data drawn from the Department of Education and Training's School Entrant Health Questionnaire indicates a continuing and increasing trend of parents, of children at school entry, reporting high levels of family stress. In 2014 the Mildura LGA had 12.4% of parents reporting high levels of family stress compared to 11.0% at the Victorian level.

##### Proportion of children at school entry whose parents report high levels\* of family stress in the past month, 2014

Mildura 12.4%

Victoria 11.0%

Time Trend – increasing proportion of children at school entry whose parents report high levels of stress between the 2012 – 2014 SEHQs ↑

##### Proportion of children at school entry whose parents report high levels\* of family stress in the past month, 2012

Mildura 11.9%

Victoria 11.4%

\* Number of children at school entry whose parents report high levels of family stress in the past month (based on the question 'Sometimes, families have times when there is more stress/pressure than usual. Overall, how would you rate your own family's stress level over the last month?' Answers are on a 5 point scale and this indicator counts responses in the highest two categories). Examples of 'stressors' include: separation and divorce of parents, death of friend or relative, move to new house, parent(s) change of job, parent's loss of job, new baby in house, remarriage of parent(s), serious illness of parent(s), serious illness of sibling(s), history of abuse to parent, history of abuse to child(ren), alcohol or drug related problem in family, history of mental illness of parent, child witness to violence, parent witness to violence, gambling problem in family.

#### 1.98 History of mental illness of parent, 2014, School Entrant Health Questionnaire 2014 (LGA) TL

Data drawn from the Department of Education and Training's School Entrant Health Questionnaire indicates a continuing and significantly increasing trend of parents, of children at school entry, reporting a history of mental illness (of a parent). In 2014 in the Mildura LGA 10.2% of parents reported a 'history of mental illness of parent' compared to only 6.9% at the Victorian level. It is important to note that the proportions at the Victorian level also increased substantially between the 2008 and 2014 reporting periods.

##### History of mental illness of parent, 2014

Mildura 10.2%

**1.99 Happy and Healthy** Adolescents have good mental health, Rate of Hospital Admissions for Mental and Behavioural Disorders, Residents aged 10-19 Years (per 10,000), 2013-16, Victorian Admitted Episodes Dataset (HOSdata), 2017 (LGA) TL

People with mental illness may require admission to hospital. In hospital, patients can receive specialised psychiatric care in a psychiatric hospital or in a psychiatric unit within a hospital. Patients with mental illness may also be admitted to other areas where health care workers may not be specifically trained to care for the mentally ill. Under these circumstances, the admissions to hospitals are classified as without specialised psychiatric care. Of significance, at the national level:

- There were more than 254,800 mental health-related separations in public and private hospitals in 2014–15, of which more than 3 in 5 (61.7%) were with specialised psychiatric care.
- Involuntary admissions accounted for almost a third (31.1%) of mental health-related separations with specialised psychiatric care.
- The largest number and highest rate of mental health-related separations with specialised psychiatric care were for patients aged 35–44 (34,030 or 10.7 per 1,000 population).
- Depressive episode and Schizophrenia were the most commonly reported principal diagnoses for separations with specialised psychiatric care (17.4% and 13.5% respectively).
- Mental and behavioural disorders due to use of alcohol and Other organic mental disorders were the most commonly reported principal diagnoses for separations without specialised psychiatric care (18.4% and 12.9% respectively).
- Indigenous Australians had a mental health-related separation rate without specialised psychiatric care that was more than 3 times that of other Australians (12.0 and 3.8 per 1,000 population respectively). <https://mhsa.aihw.gov.au/services/admitted-patient/> Accessed 13/05/2017

Over the 2013-16 period, the rate of hospital separations for mental and behavioural disorders in Mildura LGA population aged 10-19 years was 37.7 per 10,000. This rate was higher than the Regional Victoria rate of 31.2. Between 2005-08 and 2013-16, the rate of hospital separations for the Mildura LGA decreased notably.

#### 1.102 Registered mental health clients per 1,000 population, 2014-2015, Department of Health and Human Services (LGA) TL / R

When a public mental health service accepts a person's referral, for service delivery or intervention, the person becomes a client of the service and should be registered in the Client Management Interface/Operational Data Store (CMI/ODS) system. Registration involves recording demographic and clinical patient-level data for each client of a Victorian public mental health service. A client should not be registered if they are still being assessed, such as during initial referral, triage or needs assessment.

<https://www2.health.vic.gov.au/mental-health/research-and-reporting/reporting-requirements-for-clinical%20mental-health-services/registration-of-mental-health-clients>

Accessed 13/05/2017.

In 2014-2015 the Mildura LGA experienced more than twice the rate of registered mental health clients at 24.0 per 1,000 population to the Victorian rate of 11.9 per 1,000 population. These rates placed the Mildura LGA 6<sup>th</sup> of the 79 Victorian LGAs for registered mental health clients. The rate for Mildura LGA had declined slightly between the 2012-2013 and 2014-2015 reporting periods (from 25.5 to 24.0). In 2012-2013 the Mildura LGA had the second highest number of registered mental health clients of all Victorian LGAs.

#### 1.103 Estimated population with mental and behavioural problems, 2011–13, Public Health Information Development Unit (2014) modelled estimates (LGA) TL

In 2011-12, there were an estimated 3.0 million Australians (13.6%) who reported having a mental and behavioural condition, an increase from 11.2% in 2007-08 and 9.6% in 2001. The most common mental illnesses are depressive, anxiety and substance use disorders; and these three types of mental illnesses often occur in combination. Of the 20% of Australians with a mental illness in any one year, 11.5% have one disorder and 8.5% have two or more disorders. Women are more likely than men to have had symptoms of mental illness. A higher rate of anxiety disorders among women is the main contributor to this difference. The onset of mental illness is typically around mid-to-late

adolescence, and Australian youth (18-24 years old) have the highest prevalence of mental illness than any other age group. Almost one in two (45%) Australians are estimated to experience a mental illness in their lifetime. <http://phidu.torrens.edu.au/notes-on-the-data/health-status-disability-deaths/est-mental-total> Accessed 10/05/2017.

The measure below, drawn from the Public Health Information Development Unit's Social Health Atlas of Australia presents an estimate of the population with mental and behavioural problems. According to these figures 14.6 people of every 100 in the Mildura LGA will have a mental and behavioural problem compared to only 12.7 for every 100 at the Victorian level. When further differentiated according to gender the increased likelihood for both men and women in the Mildura LGA is consistent. For example 12.4 males (for every 100 males) in the Mildura LGA will have a mental and behavioural problem compared to only 10.0 males (for every 100 males) at the Victorian level, similarly 16.8 females (for every 100 females) in the Mildura LGA will have a mental and behavioural problem compared to only 14.6 females (for every 100 females) at the Victorian level.

## Domain 1: Victorians are healthy and well

### Outcome 1.2: Victorians have good mental health

#### INDICATOR – Decrease suicide

Across Victoria, males accounted for 77% of all deaths caused by self-inflicted injuries (suicides) that took place in 2014.

National figures for 2014 indicate that the greatest *number* of suicides in males and in females occurred in the 30 to 54 year age cohort. However, as a *rate* of population in the applicable age group, the highest rate of male suicides was in the 85 years and over age group, while the highest rate of female suicides was in the 35 to 44 years age group (*Causes of death, Australia, 2014, ABS 3303.0*).

#### 1.106 Deaths from suicide and self-inflicted injuries, 0 to 74 years, 2010-2014, Public Health Information Development Unit (2017) (LGA) TL

Drawing on aggregated data from 2010-2014 the Public Health Information Development Unit presents the annual average age standardised rate per 100,000 for the Mildura LGA from suicide and self-inflicted injuries (0 to 74 years) as 11.6, higher than the Victorian rate of 9.6. This represented a slight decrease from 11.7 annually for the 2009-2013 period.

#### Deaths from suicide and self-inflicted injuries, 0 to 74 years (Average annual ASR per 100,000), 2010-2014

1.107 Intentional injuries treated in hospital (per 1,000 population), 2014, Victorian Admitted Episodes Dataset (VAED) and Victorian Emergency Minimum Dataset (VEMD) (LGA) TL / R

An **intentional injury** is an injury as a result of deliberate acts by people; that is, harm of one person by another (assault, homicide, neglect) or self-harm. This measure reflects the rate per 1,000 population of intentional injuries treated in hospital, which includes both emergency department presentations and hospital admissions. An injury emergency department presentation is defined as an injury or poisoning that results in a person presenting to a hospital emergency department for treatment and who is triaged (assessed for urgency), including those patients who leave before treatment commences. An injury hospital admission is defined as an injury or poisoning which results in the person being admitted to a hospital bed and being discharged alive after one or more night's stay.

For the 2014-2015 reporting period the Mildura LGA ranked first amongst the 79 Victorian LGAs for intentional injuries treated in hospital with 7.4 per 1,000 population compared to the Victorian rate of 3.0 per 1,000. For the Mildura LGA this had increased from 7.2 per 1,000 during the 2012-2013 reporting period.

## Domain 1: Victorians are healthy and well

### Outcome 1.3: Victorians act to protect and promote health

#### INDICATOR - Increase healthy eating and active living

Modifiable health risk factors are those that are potentially modifiable through changes in lifestyle and/or treatment. Some of these risk factors, such as smoking, excess consumption of alcohol, physical inactivity and unhealthy diet, are often referred to as 'lifestyle risk factors'.

This report presents information on modifiable risk factors that influence health including smoking, alcohol consumption and psychological distress and fruit and vegetable intake, consumption of sugar-sweetened soft drinks, physical activity, pre-obese (overweight) and obesity.

In quantifying the relative contribution of various modifiable risk factors, Begg and colleagues (2003) determined that 14 selected risk factors accounted for 32.2% of the total burden of death, disease and injury. These are outlined in the table right. The remaining 67.8% of the total burden of disease is not accounted for by known modifiable risk factors. It is here that the underlying social determinants of health make their contribution to death, disease and injury (DHHS, 2016).

By 2010 dietary factors were the largest attributable risk factor for burden of disease in Australia, accounting for 10.5% of the total, followed by excess weight or high body mass (8.4%) and smoking (8.3%) (DHHS, 2014).

<https://www2.health.vic.gov.au/about/publications/policiesandguidelines/Mildura%20RC> Accessed 13/03/2017

*"Two-thirds of Victorian adults consume too many kilojoules, and Victorian children are getting about 40% of their energy intake from discretionary foods. These consumption patterns are fuelling our epidemic of obesity and chronic disease. The current societal environment is one that offers disproportionate access, affordability and promotion of discretionary foods that are the major contributors to poor diets" (DHHS, 2014).*

*"Poor diet is the largest cause of early death and ill health – more than smoking – and is estimated to cause 9,000 deaths a year" (DHHS, 2014).*

#### 1.114 1.3.1.1.A Proportion of the population who do not meet fruit and vegetable consumption guidelines, 2014, Victorian Population Health Survey, DHHS

Daily intake of fruit and vegetables is used as a proxy measure of the quality of a person's diet in Australia and internationally. New Australian dietary guidelines were introduced in 2013, altering some of the serving sizes and recommendations for fruit and vegetable consumption based on sex and age. Analysis of the Victorian Population Health Survey 2014 data has been undertaken using the 2013 Australian guidelines.

The 2013 Australian guidelines recommend a minimum daily vegetable intake of 5½ serves for men 18 years of age or 51–70 years of age, six serves for men 19–50 years of age and five serves for men 71 years of age or older. The recommended minimum daily vegetable intake for women 18 years of age or older is five serves, where a serve is defined as half a cup of cooked vegetables or a cup of green leafy or raw salad vegetables. The recommended minimum daily fruit intake is two serves for people 12–18 years of age and two serves for those 18 years of age or older, where a serve is defined as one medium piece or two small pieces of fruit or one cup of diced pieces (DHHS, 2016).

Based on these 2013 Guidelines 54.7% of the Mildura LGA population are not meeting the recommended minimum daily intake of fruit and vegetables compared to 48.6% of their Victorian counterparts – affording the Mildura LGA a rank of 10<sup>th</sup> from all 79 Victorian LGAs. More positively however less of the Mildura LGA population is not meeting these guidelines than was the case in 2011-2012 (57.4%).

##### Proportion of the population who do not meet fruit and vegetable consumption guidelines, 2014

1.123 Eating breakfast (Grade 4), 2016, Middle Years Development Instrument (LGA)

Eating breakfast not only increases nutrient intake for building strong bodies, it also immediately improves cognitive, behavioural, and emotional functioning, including memory. Studies have found that skipping breakfast is more common among girls, children in lower socioeconomic families, and among older children.

The Middle Years Development Instrument (MDI) found that 18% of Grade 4 students across the Mildura LGA ate breakfast 2 or fewer times per week.

How often do you eat breakfast? (Grade 4) (2 or fewer times per week), 2016

#### 1.125 **1.3.1.3.A** Proportion of adult population who consume sugar sweetened beverages daily, 2014, Victorian Population Health Survey, DHHS

The evidence shows that consumption of sugar-sweetened soft drinks has significantly contributed to the obesity epidemic. The consumption of sugar-sweetened beverages is not only associated with weight gain but also with increased risk of other health problems such as dental caries, high blood pressure, type 2 diabetes and cardiovascular disease.

In the 2011–12 Victorian Population Health Survey questions were included for the first time to measure the consumption of sugar-sweetened soft drinks in Victoria. The term ‘sugar-sweetened soft drinks’ refers to any beverage with added sugar, and includes carbonated drinks, flavoured mineral water, cordial, sports drinks and energy drinks. Ready-to-drink alcoholic beverages were also included as sugar-sweetened beverages as they are mixed with other flavours such as fruit juice or soft drink. All clear, non-flavoured mineral water and soda water were excluded. At the Victorian level the proportion of the adult population who drank these soft drinks daily was significantly higher in 25–34-year-old men and women compared with all Victorian men and women (DHHS, 2016).

Across the Mildura LGA the 2014 VPHS revealed that 9.3% of the adult population consumed sugar sweetened beverages daily compared to 11.2% of the Victorian adult population. This lower rate saw the Mildura LGA ranked 61<sup>st</sup> of the 79 Victorian LGAs.

1.128 **Happy and Healthy** Children have a healthy childhood, Proportion of infants fully breastfed at discharge from hospital, 2014/2015, DET Maternal and Child Health Mildura LGA 2015/2015 Data Report (LGA) TL

*'breastfeeding is an unequalled way of providing ideal food for the healthy growth and development of infants' World Health Organisation*

Breastfeeding until at least six months of age has been recommended internationally by the World Health Organisation (WHO) and in Australia by the National Health and Medical Research Council (NHMRC). The NHMRC *Infant Feeding Guidelines* also recommend continued breastfeeding to around 12 months. Breastfeeding is known to provide nutrition and strengthen the immune system, resulting in benefits for both mothers and babies. Early childhood nutrition is important for an infant's survival, growth and development, and to enhance health throughout the lifecycle. For infants, it provides many health benefits, including reducing the risk of infection, asthma, allergies and sudden infant death syndrome (SIDS). It also helps to improve cognitive development and offers protection against obesity and chronic diseases in later life. Breastfeeding may assist with bonding and attachment between the mother and the baby. For mothers, it provides many positive health effects, such as reducing the risk of some cancers and osteoporosis (AIHW, 2012 and DEECD, 2013).

Mothers may not breastfeed or discontinue breastfeeding their infants for a number of reasons including difficulty breastfeeding and unsupportive environments for breastfeeding (DHHS, 2017a).

Data drawn from the 2014/2015 Maternal and Child Health report would indicate a slightly higher proportion of infants in the Mildura LGA are fully breastfed at discharge from hospital (73.8%) than the Victorian rate (72.8%). However from this point onwards all Mildura LGA breastfeeding rates at the captured ages of 2 weeks, 3 months and 6 months sit below the corresponding Victorian rates. A trend which is also consistent over the 2012/2013 to 2014/2015 reporting periods.

#### 1.133 1.3.1.6.A Proportion of adults who are sufficiently\* physically active, 2014, Victorian Population Health Survey, DHHS (LGA)

Physical inactivity is a major modifiable risk factor for a range of conditions, including cardiovascular disease, type 2 diabetes, some cancers, osteoporosis, depression, anxiety and falls among the elderly. Moreover, physical activity improves cognitive function in the elderly, prevents weight gain and, in conjunction with a low-calorie diet, promotes weight loss. The evidence suggests that health benefits accrue with increasing levels of physical activity and that this protective effect occurs even if adopted in middle and later life. Therefore physical activity is an obvious target for health promotion.

The level of health benefit achieved from physical activity partly depends on the intensity of the activity. In general, to obtain a health benefit from physical activity requires participation in moderate-intensity activities (at least). Accruing 150 or more minutes of moderate-intensity physical activity (such as walking) or 75 or more minutes of vigorous physical activity and doing muscle-strengthening activities on at least two days on a regular basis over one week is believed to be 'sufficient' for health benefits and is the recommended threshold of physical activity for adults between 18 and 64 years of age according to *Australia's physical activity and sedentary behaviour guidelines* (DoH 2014). These national guidelines also recommend minimising the amount of time spent in prolonged sitting and to break up long periods of sitting as often as possible. The guidelines recommend that people 65 years of age or older should accumulate at least 30 minutes of moderate-intensity physical activity on most days.

Based on these Guidelines and drawing on data from the 2014 Victorian Population Health Survey 45.6% of adults in the Mildura LGA are sufficiently physically active compared to only 41.4% of their Victorian counterparts.

##### Proportion of adults who are sufficiently\* physically active, 2014

#### 1.134 Percentage of persons who do not meet physical activity guidelines (persons, males, females), 2014, Victorian Population Health Survey (LGA) TL / R

Similarly only 46.5% of the Mildura LGA population DO NOT meet physical activity guidelines compared to their Victorian counterparts (54.0%) affording the Mildura LGA a rank of 73 from the 79 Victorian LGAs.

When differentiated by gender, below, it is revealed that whilst both men and women in the Mildura LGA are performing more favourably than their Victorian counterparts but for Mildura LGA men this is especially so. For example women in the Mildura LGA DO NOT meet physical activity guidelines 53.8% of the time compared to 56.1% of Victorian women (affording Mildura LGA women a rank of 45 from 79 LGAs). Men in the Mildura LGA DO NOT meet physical activity guidelines 38.1% of the time compared to 52.0% of Victorian men (giving Mildura LGA men a rank of 75 from 79 LGAs).

1.137 Physical Activity - 0 days per week, 2015, VicHealth Indicators 2015 (LGA) TL

Increasing participation in physical activity has health, social and economic benefits. The benefits of regularly engaging in physical activity are improved physical health, reduced risk of chronic disease, reduced risk of becoming overweight or obese, the development of stronger social connections, and improved mental wellbeing. Yet research shows that physical activity levels vary by social position. ABS Census data reveals that Australians with lower levels of education, those who are unemployed, or those living in socioeconomically disadvantaged neighbourhoods are more likely to be inactive or do low levels of physical activity. Aboriginal and/or Torres Strait Islander adults are less likely to be physically active than non-Aboriginal and/or Torres Strait Islander adults, and females tend to be less active than males throughout their lifespan.

In Australia, the estimated cost of physical inactivity to the health sector is over \$672 million dollars per year. The potential savings to the Australian health sector from reducing physical inactivity by just 10% is \$96 million per year, with an increase in leisure, home and workforce productivity of \$162 million (DHHS, 2016).

The 2015 VicHealth Indicators Survey explored 4 dimensions of physical activity including:

- Physical activity frequency (30 minutes or more) by days per week
- Participation in organised physical activity
- Participation in non-organised physical activity
- Sedentary behaviour at work

The first three of which are explored below.

The 2015 VicHealth Indicators survey reveals that 20.3% of the Mildura LGA population undertakes physical activity '0' days per week compared to their Victorian counterparts who undertake '0' days of physical activity per week (18.9%).

#### Physical Activity – 0 days per week, 2015

Similarly a lesser proportion of Mildura LGA's adult population walked for transport for trips longer than 10 minutes with 65.6% indicating they DO NOT do this at all compared to their Victorian counterparts (57.4%).

Proportion (%) of adult population who walked for transport for trips longer than 10 minutes during the preceding week (none), by frequency, 2014

Mildura 65.6%

Victoria 57.4%

#### 1.141 **1.3.1.9** Proportion of adults sitting for eight or more hours on an average weekday, 2014 Victorian Population Health Survey DHHS (LGA)

Respondents were asked about the time they spent sitting while at work, while at home, while doing study and during leisure time. This included time spent sitting at a desk, in the car, reading or sitting or lying down to watch television. At the Victorian level a significantly higher proportion of men spent eight hours or more sitting on an average weekday during the preceding week compared with the proportion of women. A significantly higher proportion of men 25–54 years of age spent eight hours or more sitting compared with all Victorian men.

Positively a lesser proportion of Mildura LGA's adult indicated they sit for eight hours or more on an average weekday (15.6%) compared to their Victorian counterparts (23.8%).

##### Proportion of adults sitting for eight or more hours on an average weekday, 2014

Mildura 15.6%

Victoria 23.8%

For adults sitting for 6 hours but less than 8 hours on an average weekday Mildura LGA's adult population was slightly higher (14.9%) than their Victorian counterparts (14.4%).

##### Proportion of adults sitting 6 - <8 hours on an average weekday, 2014

Mildura 14.9\*%

Victoria 14.4%

Source: Department of Health and Human Services 2016, Victorian Population Health Survey 2014: Modifiable risk factors contributing to chronic disease, State Government of Victoria, Melbourne.

#### 1.142 Percentage of persons who sit for at least 7 hours per day, 2011, VicHealth Indicators Survey 2011 (LGA) TL / R

Similar data, captured through the 2011 VicHealth Indicators Survey, would confirm the more significantly positive findings indicating that only 24.8% of the Mildura LGA population sits 'for at least 7 hours per day' compared to 32.6% of their Victorian counterparts.

##### Percentage of persons who sit for at least 7 hours per day, 2011

Mildura 24.8%

Victoria 32.6%

Rank 43

#### 1.146 Use of After-School Time, (Grade 4), 2016, Middle Years Development Instrument (LGA)

The MDI sought to better understand how school-aged children spend their after-school hours (from 3pm to 6pm). These are known as the “critical hours” because they are the hours in which children are most often left unsupervised. Broadly this time is either organised into structured activities or unstructured activities.

Children’s involvement in activities outside of school hours exposes them to important social environments. Organised after-school activities such as art and music classes, sports, and community groups provide distinct and important experiences that have been shown to boost children’s competence, self-esteem, school engagement, personal satisfaction and academic achievement. After-school activities allow children to meet new friends, to strengthen existing friendships, and to feel like they belong to a group of peers with shared interests. For some children, after-school programs can serve as an opportunity to bridge the gap between family and peers. Children who are more involved in extracurricular activities tend to experience better school success and are less likely to drop out.

The MDI also explores children’s experiences in unstructured activities. Children are asked about the type of unstructured activities they are involved in and how often they are involved in these activities during after-school hours. At the Victorian level completing homework assignments, watching television or videos (including Netflix and YouTube), and computer use are three unstructured activities that children report spending most of their time on during the after-school period.

Ultimately a balance of several activities both structured and unstructured, rather than spending a lot of time on any one particular interest or activity, is the most optimal for supporting children’s holistic development. Four results for the ‘use of after-school time’ indicator are reported here for the Mildura LGA – ‘any organised activity’, ‘playing video or computer games’, ‘watching TV or netflix’ and ‘doing homework’.

Any Organised Activity (Grade 4) - During last week after school (from 3pm-6pm), how many days did you participate in: any after-school activity that was structured and supervised by an adult (2+ times per week), 2016

#### 1.148 Frequency of Good Sleep (Grade 4), 2016, Middle Years Development Instrument (LGA)

School-age children need approximately ten hours of sleep a night. Proper sleep not only affects children's cognitive capacities, but also helps regulate mood. Children who are not getting enough sleep are at risk for developing behavioural problems that closely mimic symptoms associated with ADHD: hyperactivity, impulsivity and problems sitting still and/or paying attention. Short sleep duration is also associated with the development of obesity from childhood to adulthood. Children were asked: "How often do you get a good night's sleep?" and "What time do you usually go to bed during the weekdays?"

Drawing on the Middle Years Development Instrument 21% Grade 4 students in the Mildura LGA were identified as experiencing a 'good night's sleep' two or fewer times per week.

Frequency of Good Sleep (Grade 4) (2 or fewer times per week), 2016

## Domain 1: Victorians are healthy and well

### Outcome 1.3: Victorians act to protect and promote health

#### INDICATOR – Reduce overweight and obesity

Excess weight is a condition of abnormal and excessive fat accumulation, to the extent that the health and wellbeing of an individual may be adversely affected. Excess weight is a major determinant of premature death and avoidable ill health. It affects the risk of CVD, type 2 diabetes, musculoskeletal conditions and some cancers. In addition to affecting the health of the individual, overweight and obesity places an increasing burden on health services, social support and economic productivity. Childhood obesity has both intermediate and long-term effects on health and wellbeing with excess weight in children often leading to excess weight in adults (DHHS, 2017a).

Weight gain is generally caused by an imbalance between energy intake and energy expenditure. While the factors driving this imbalance at a population level are complex, it is clear that poor nutrition is a key cause of overweight and obesity. In Victoria adult obesity rates, but not overweight, are strongly associated with socioeconomic disadvantage. At the population level, a common indicator of excess weight (approximating body fat) is the body mass index (BMI) (DHHA, 2014 & DHHS, 2015).

Obesity reduces life expectancy and is now ranked above smoking as a cause of disease burden. International studies have shown that median survival of obese people was reduced by two to four years and eight to 10 years for the severely obese. High body mass was estimated to directly or indirectly cause 18,500 deaths in Australia in 2010, indicating that about 4,600 deaths in Victoria in 2010 were associated with high body mass. As discussed above, dietary factors were estimated to cause about 9,000 deaths in Victoria in 2010. For comparison, cancer was the cause of about 11,000 deaths in Victoria in 2010, and 326 deaths were due to transport accidents (DHHS, 2014, p24).

The cost of obesity is high. It has been estimated that the financial cost in Victoria alone in 2008 was \$2.052 billion, with a total of \$8.283 billion nationally. Of this, 44% was due to productivity losses, 24% to health system costs, 23% to carer costs and the remaining were principally due to indirect costs. Yet obesity has more than just financial effects – the cost of lost wellbeing based on burden of disease was about six times that of the financial cost in 2008. In Victoria the total cost of obesity in 2008 was \$14.410 billion, with \$12.358 billion due to lost wellbeing. Some estimates suggest that the cost of obesity to health care systems in developed economies could approach up to 20% of all health care spending (DHHS, 2014).

Importantly the results of the Victorian Population Health Survey (as reported below) rely on self-report. Studies comparing self-reported height and weight with actual physical measurements have shown that, when asked to self-report, people tend to underestimate their weight and overestimate their height (DHHS, 2014). For example, at the Victorian level, the results of the 2011–12 Victorian Population Health Survey indicate that half (50.1%) of all people aged 18 years or older were overweight or obese. By contrast the results from the Australian Health Survey 2011–12 show that 61.0% of all Australian people aged 18 years or older were overweight or obese (DHHS, 2014, p166). Bearing this in mind readers can assume that locally results are somewhat worse than depicted below.

1.150 **1.3.2.1.B** Proportion of adult population who are overweight or obese (self-report), 2014, Victorian Population Health Survey

*"Nearly two-thirds of Victorian adults (61%) and one in four children (24%) were measured as overweight or obese in 2011–12..... Being overweight has become a normal condition, and Victoria is now becoming an obese society" (DHHS, 2015).*

"Obesity prevalence increased by 29% between 2003 and 2011–12" (DHHS, 2014)

According to the 2014 Victorian Population Health Survey 53.2% of the Mildura LGA population were either overweight or obese, comparing unfavourably to their Victorian counterparts at 50.0%. By contrast when asked about being overweight (only) 29.0% of Mildura LGA participants agreed compared to a higher rate of all Victorians at 31.2%.

## Domain 1: Victorians are healthy and well

### Outcome 1.3: Victorians act to protect and promote health

#### INDICATOR – Reduce smoking

1.158 **1.3.3.1.A** Proportion of adult population who smoke daily, 2014, Victoria Population Health Survey DHHS (LGA)  
Percentage of persons 18+ who are current smokers, 2014, Victorian Population Health Survey (LGA) TL / R

Smoking is an important risk factor for the three diseases that cause most deaths in Australia: heart disease, stroke and lung cancer. Smoking is responsible for around 80% of all lung cancer deaths and has also been linked to cancers of the mouth, pancreas, bladder, kidney, stomach and cervix (among others) and to respiratory diseases such as chronic obstructive pulmonary disease and emphysema (DHHS, 2014).

Whilst in 2011–12 18.6% of men and 12.9% of women aged over 18 years were current smokers the prevalence of current smoking in Victoria continues to decline for both men and women. Between 2003 and 2014, the prevalence of current smoking declined by almost 40% (3.6% per year), representing an absolute percentage point reduction of 8.8% over 11 years. The decline in the prevalence of smoking was particularly marked among women, where the 2014 estimate was significantly lower than the estimate in 2010, and there has been a relative decline of 42.3% since 2003. There was a lower relative decline among men of 38.2% (DHHS, 2016).

However, the rate of decline is also not been experienced equally across the whole population – smoking disproportionately affects disadvantaged population groups, with smoking rates higher among Aboriginal people, people who experience psychological distress, people with a lower level of education, people who live in rural areas and people on low incomes or who are unemployed (DHHS, 2015). Of the men whose household income was less than \$40,000 per annum, 32.1% were current smokers compared with 15.8% of those with an annual household income greater than \$100,000 per annum. For women, 20.6% of those with a household income less than \$40,000 were current smokers (DHHS, 2014 p126).

One in eight women continues to smoke while pregnant, with rates three times higher for Aboriginal women. After 20 weeks gestation one in 20 pregnant women smoke, with the rate four times higher for teenagers and more than double in rural areas compared with metropolitan areas (DHHS, 2015).

Approximately one in five Victorian children aged 5–12 years live in a household with a smoker. Children in areas of least disadvantage are about three times less likely to live in a household with a smoker than those in most disadvantaged areas. In 2008 two-thirds of Aboriginal children lived in households with a daily smoker, more than twice that for non-Aboriginal children. Further, smoking rates were about double for those with psychological distress; and homosexual and bisexual Australians aged 14 years and older were twice as likely to be current smokers in 2010 (DHHS, 2015)

There are several ways of classifying smoking status. The Victorian Population Health Survey defines smokers as ‘daily’ or ‘occasional’ and combines the two to report on ‘current smokers’. A person is categorised as an ‘ex-smoker’ if he/she has smoked at least 100 cigarettes or a similar amount of tobacco in their lifetime. By contrast Cancer Council Victoria defines smokers as ‘regular smokers’ if they smoke daily or at least weekly, and ‘irregular smokers’ if they smoke less than weekly. It defines ‘former smokers’

in the same way as the Victorian Population Health Survey defines ‘ex-smokers’. The Australian Bureau of Statistics (ABS) reports on both ‘current daily smokers’ and ‘current smokers’, which includes current daily, weekly and less than weekly smokers (DHHS, 2016).

*“12% of Victorian adults smoke daily and 41% of Aboriginal people smoke daily” (DHHS, 2015)*

*“12% of 16-year-old and 16% of 17-year-old Victorian school students smoked in the last week” (DHHS, 2015)*

Drawing on data from the 2014 Victorian Population Health Survey reveals 18.7% of the Mildura LGA population aged 18 years and over are current smokers (i.e. are smoking daily or occasionally), compared to only 13.1% of their Victorian peers. These figures indicate the proportion of the Mildura LGA who are current smokers has increased between the 2011-2012 and 2014 reporting periods. The 2014 VPHS data is detailed further in the table below.

Mildura	18.7%	23.8%	57.3%
Victoria	13.1%	24.8%	61.5%

When the 'current' smoker measure is further differentiated into smoking daily versus smoking occasionally the Mildura LGA population remains well above their Victorian counterparts with 16.9% of the adult population identifying as smoking daily compared to 9.8%. Again for the Mildura LGA this proportion was trending up from the 2011-2012 findings.

Proportion of adult population who smoke daily, 2014

Mildura 16.9\*%

Victoria 9.8%

Time Trend – an increasing proportion of the adult population identified as 'smoking daily' between the 2011-2012 and 2014 Victorian Population Health Survey reporting periods ↑

When the 2011 Victorian Population Health Survey is further differentiated by gender it reveals females within the Mildura LGA were more likely to be current smokers than their male counterparts. Of all females aged 18 years and over 16.2% were current smokers compared to only 12.9% of the Victorian counterparts earning them a rank of 20<sup>th</sup> of the 79 Victorian LGAs. By comparison males in the Mildura LGA were ranked of 52<sup>nd</sup> with 15.9% of males aged 18 years and over identifying as current smokers compared to 18.5% of their Victorian counterparts.

1.161 1.3.3.3 Proportion of children exposed to tobacco smoke in the home, 2013, VCHWS DET (Mallee Region only) TL

The health risks from tobacco increase the earlier a person takes up the habit and the longer they smoke. Monitoring the age of initiation of smoking will provide information on the uptake of smoking among young people (DHHS, 2017a).

Passive smoking, or exposure to second hand smoke, is a cause of premature death and disease in children and in adults who do not smoke. Even small amounts of exposure to tobacco smoke can be harmful to people's health. Compared with adults, children are particularly susceptible to the effects of second-hand smoke. Children are most likely to be exposed to second-hand smoke in the home. As exposure to second-hand smoke can be so pervasive, even comparatively small increases in disease risk for individual children may translate into a substantial burden of disease in the child population (DHHS, 2017a).

Data drawn from the Victorian Child Health and Wellbeing Survey (VCHWS) is presented through the VCAMS Portal for the Mallee Region revealing that less children in the Mallee Region are exposed to tobacco smoke in the home (17.9%) than their Victorian counterparts (18.5%).

Proportion of children exposed to tobacco smoke in the home, 2013

## Domain 1: Victorians are healthy and well

### Outcome 1.3: Victorians act to protect and promote health

#### INDICATOR - Reduce harmful alcohol and drug use

*“2.8% of Australia’s burden of disease is due to alcohol use and 2.6% to drug use” (DHHS, 2015)*

*“20% of the national self-harm burden, 14% of the interpersonal violence burden and 7.5% of the unintentional injury burden (other than road transport) is due to alcohol use” (DHHS, 2015)*

The health and social impacts of harmful and hazardous consumption of alcohol and drugs are considerable. One study estimated costs including crime, loss of life, loss of production, road accidents and health care are about \$24.6 billion per year in Australia (DHHS, 2015).

Although alcohol and other drug dependency can be viewed and treated as a chronic illness, many of the harms associated with alcohol are not about addiction but long-term regular drinking or single occasion risky (binge) drinking. Research shows that long-term and regular alcohol consumption, not only binge drinking, is linked to disease, including some cancers and even cardiac illness. Long-term and frequent alcohol use is also a risk factor for alcohol related dementia and other acquired brain injuries (DHHS 2015).

The long-term consequences of regular use of alcohol may include cirrhosis of the liver, cognitive impairment, heart and blood disorders, ulcers, cancers and damage to the pancreas. In the short term, heavy drinking can result in acute alcohol-related problems, violence, risky behaviour, road trauma and injury. Significant psychosocial and economic consequences also arise from such patterns of drinking, not only for the individuals concerned, but also for their families and the wider community (DHHS, 2014).

Some drugs can trigger the onset of a pre-existing mental illness. Using frequent or large quantities of some drugs such as crystal methamphetamine (‘ice’) can cause drug induced psychosis. Alcohol and drug use is also closely associated with a range of mental health issues, and particularly anxiety and depression (DHHS 2015).

Suicide Prevention Australia has found that people who abuse alcohol may be at up to six times greater risk of suicide than the general population, while cannabis users may be at 10 times greater risk of suicide. Alcohol disorders are the second most commonly diagnosed disorder among those who die by suicide (DHHS, 2015).

A further risk factor for problematic alcohol and drug use is the experience of trauma and in particular sexual violence. Excessive alcohol and drug use can contribute to the frequency and likelihood of being involved in violence. Recent research has attributed the excessive use of alcohol as a preventable risk factor in some family violence incidents (DHHS, 2015).

Based on the 2001 National Health and Medical Research Council (NHMRC) guidelines, long-term risk of harm due to alcohol consumption is associated with regular daily patterns of drinking alcohol, defined in terms of the amount typically consumed each week (43 or more standard drinks per week for men, 29 or more standard drinks per week for women). Short-term risk of harm due to alcohol consumption is associated with drinking levels on a single occasion (more than six standard drinks on a single occasion for men, more than four standard drinks on a single occasion for women).

In 2009 the NHMRC released the Australian guidelines to reduce health risks from drinking alcohol, replacing the previous guidelines issued in 2001. The new NHMRC (2009) guidelines go beyond looking at the immediate risk of injury and the cumulative risk of chronic disease, to estimating the overall risk of alcohol-related harm over a lifetime, and provides universal guidance applicable to healthy adults 18 years of age or older (guidelines 1 and 2) and guidance specific to children and young people (guideline 3) and to pregnant and breastfeeding women (guideline 4). Only guidelines 1 and 2, listed below, apply to respondents of the Victorian Population Health Survey, as the survey is administered to adults aged 18 years and over (DHHS, 2016).

**National Health and Medical Research Council (NHMRC) guidelines to reduce health risks from drinking alcohol**

**Guideline 1:** Reducing the risk of alcohol related harm over a lifetime: For healthy men and women, drinking no more than TWO standard drinks on any day reduces the lifetime risk of harm from alcohol-related disease or injury.

**Guideline 2:** Reducing the risk of injury on a single occasion of drinking: For healthy men and women, drinking no more than FOUR standard drinks on a single occasion reduces the risk of alcohol-related injury arising from that occasion.

1.163 **1.3.4.1.A** Proportion of adult population who consume alcohol at (increased) lifetime risk of alcohol-related harm, 2014, Victorian Population Health Survey DHHS (LGA)

Excess alcohol consumption is responsible for a considerable burden of death, disease and injury. Excessive long-term alcohol consumption increases the risk of CVD, diabetes, liver cirrhosis and some types of cancers. Alcohol-related harm can also extend beyond the individual to impact families and the broader community through increased street-based violence, sexual assault, family violence, avoidable injuries, road trauma and reduced public safety. As more alcohol is consumed on a single occasion, skills and inhibitions decrease while risky behaviour increases, leading to a greater risk of injury during or immediately after that occasion (DHHS, 2017a).

Based on this understanding 59.3% of the adult population in the Mildura LGA consume alcohol at an (increased) lifetime risk of alcohol related harm compared to 59.2% of the Victorian peers.

1.168 **1.3.4.1.C** Proportion of young people who have ever drunk alcohol (more than a few sips), 2014, About You DET (Mallee Region only) TL

*“25% of 16-year-old and 37% of 17 year old Victorian school students drink alcohol” (DHHS, 2015)*

Risks of injury, violence and self-harm are high among drinkers aged less than 18 years. Drinkers under 15 years of age are much more likely than older drinkers to experience risky or antisocial behaviour connected with their drinking, with the rates also somewhat elevated among drinkers aged 15-17 years. In addition, earlier initiation of drinking is related to more frequent and higher quantity alcohol consumption in adolescence, and these patterns are in turn related to the development of alcohol-related harms in adolescence and adulthood (DHHS, 2017a).

The Department of Education and Training’s 2014 Victorian Student Health and Wellbeing Survey (VSHAWS) also known as ‘About You’ reveals that young people in the Mallee Region were far more likely to ‘have ever drunk alcohol (more than a few sips)’ (70.2%) when compared to their Victorian peers (59.5%).

#### 1.169 Rate\* of alcohol related hospitalisations - time series (rate per 10,000 population), 2011/12 to 2014/15, AODstats, Turning Point

In 2014/15, Mildura LGA had a lower rate (40.5) of residents that had been hospitalised for alcohol related harm compared to the Victorian average (55.0) and this pattern was also evident between 2011/12 and 2013/14. In 2014/15 the hospitalisation rate for Mildura LGA males (66.9) was much higher than for females (14.9) and was similar to the state male rate (67.8), this pattern was consistent across each reported year. Rates of hospitalisations for Mildura LGA residents age 65 years and over were higher than their Victorian counterparts (81.6 versus 70.9 in 2014/15 and 81.3 versus 63.1 in 2013/14).

Rate\* of alcohol related hospitalisations - time series (rate per 10,000 population), 2011/12 to 2014/15

Year	Location	Total	Male	Female	0-14	15-24	25-39	40-64	65 +
2014/15	Mildura LGA	40.5	66.9	14.9	0.0	8.5	39.5	58.0	81.6
	Victoria	55.0	67.8	42.5	0.4	26.2	50.1	94.8	70.9

Source: AODstats, Turning Point - Eastern Health, accessed July 2017

\*Rate per 10,000 population np = no data published (different to a zero count)

#Figures are for affected family members in family incidents that were definitely alcohol related.

*"14% of people in Victoria used an illicit drug in the previous 12 months" (DHHS, 2015)*

Illicit drug use can cause serious harm to individuals, their families and the broader community. A considerable number of lives are lost every year to overdose, and illicit drug use can be a contributing factor in road trauma, crime, family violence, illness, lost opportunity, and reduced productivity. Monitoring illicit drug related ambulance attendances enables assessment of the prevalence of non-fatal impacts of illicit drugs, which may or may not require hospitalisation (DHHS, 2017a).

#### 1.170 Proportion of young people who have ever used marijuana or other illegal drugs, 2014, About Your DET (Mallee Region only) TL

Paralleling alcohol consumption the Department of Education and Training's 2014 About You Survey revealed that young people in the Mallee Region were more likely to 'have ever used marijuana or other illegal drugs' (18.6%) compared to their Victorian peers (12.8%).

#### 1.171 1.3.4.3.A Rate of alcohol related ambulance attendances (person, males, females), 2014/2015 Victorian Ambulance Clinical Information System (VACIS®) Ambulance Vic (LGA)

Monitoring alcohol, prescription drug and illicit drug related ambulance attendances enables assessment of the prevalence of non-fatal impacts of consumption of these substances, which may or may not require hospitalisation (DHHS, 2017a).

In 2014/2015 alcohol related ambulance attendances were higher per 100,000 population in the Mildura LGA (392.2) than in Victoria (369.8). Further these attendances had increased between the 2011/12 and 2014/15 reporting periods (up from 362.4 to 392.2). This above Victorian rate and increasing rate between reporting periods was mirrored for males in the Mildura LGA. In contrast alcohol related ambulance attendance rates for females in the Mildura LGA were below their Victorian counterparts in 2014/2015 and fell between the 2011/12 and 2014/15 reporting periods.

#### 1.175 Clients that received Alcohol & Drug Treatment Services per 1,000 population, 2014-2015, Alcohol and Drug Information System (ADIS), Department of Health and Human Services (LGA) TL / R

The following measure reports the number of residents of the Mildura LGA, per 1,000 population, who received treatment from alcohol and drug treatment services. This item refers to the number of individuals, not to the number of completed courses of treatment. For the Mildura LGA this rate was 10.9 per 1,000, more than twice the Victorian rate of 5.0 per 1,000, affording the Mildura LGA a rank of 5<sup>th</sup> amongst the 79 Victorian LGAs.

##### Clients that received Alcohol & Drug Treatment Services (per 1,000 population), 2014-2015

## Domain 1: Victorians are healthy and well

### Outcome 1.3: Victorians act to protect and promote health

#### INDICATOR – Increase immunisation

Immunisation has been repeatedly demonstrated to be one of the most effective medical interventions to prevent disease. Vaccines are a safe and effective way to give children immunity against a number of potentially serious diseases (DHHS, 2014).

Immunisation is one of the most cost-effective public health interventions by which to maintain and protect the health of the population through reducing, eliminating and eradicating preventable communicable diseases. Immunisation not only protects the individual but also protects the wider community from the spread of infection by decreasing the number of susceptible people in the population. Improvements in childhood vaccination coverage need to be maintained and gaps and inequities in coverage addressed in order to achieve the lowest possible incidence of vaccine-preventable diseases in the population (DHHS, 2014).

The National Immunisation Program schedule specifies vaccines for children at different age milestones. Thirteen diseases are covered by the routine childhood vaccination schedule: hepatitis B, rotavirus, diphtheria, tetanus, pertussis (whooping cough), poliomyelitis, *Haemophilus influenza* type b (Hib), pneumococcal, meningococcal C, measles, mumps, rubella and varicella (chickenpox). Vaccine coverage data is presented for Victorian children aged 60 to less than 63 months. These children have received their fourth vaccination for diphtheria, tetanus, pertussis, poliomyelitis and their second vaccination for measles, mumps and rubella, all prior to the age of five years. It is assumed that all previous vaccine doses were received.

Australian immunisation providers have contributed data to the Australian Childhood Immunisation Register (ACIR) since 1996. The ACIR, administered by Medicare Australia, is a national database containing data on immunisation given to children under seven years of age who are living in Australia. Details of vaccinations given to children are forwarded to the ACIR by recognised providers, for inclusion on the register in order to monitor immunisation coverage and service delivery.

As at 30 September 2014 the proportion of children aged between 60 and less than 63 months who received all scheduled vaccinations in Victoria was 92.6%, the second highest among all jurisdictions in Australia, and consistent over recent years (DHHS, 2014).

#### 1.176 1.3.5.1 Notification rate for vaccine preventable diseases, 2016, Public Health Event Surveillance System (PHESS) DHHS (LGA)

Vaccine preventable diseases are most commonly monitored using reports of disease notifications (predominantly laboratory diagnoses), hospitalisations and deaths. Notification rates indicate disease incidence in the population (DHHS, 2017a).

Immunisation is one of the most effective medical interventions to prevent disease. Vaccination not only protects individuals, but also others in the community, by increasing the level of immunity in the population and minimising the spread of infection. Proper and timely immunisation effectively protects children from a host of debilitating and sometimes deadly diseases and is most effective when a high proportion of the population has been immunised (DHHS, 2017a).

According to the surveillance of notifiable conditions in Victoria the rate of vaccine preventable diseases for the Mildura LGA (217.9 per 100,000) is less than that for Victorian (444.8 per 100,000). For the Mildura LGA there was a decrease in actual notifications between 2014 (162 notifications) and 2016 (109 notifications).

Annual Totals (and rate per 100,000#), notification rate of vaccine preventable diseases, 2016, Surveillance\* of notifiable conditions in Victoria

Mildura 109 (217.9)

Victoria 25,776 (444.8)

Time Trend – Mildura decreased from 162 vaccine preventable disease notifications in 2014 to 109 notifications in 2016. Accurate time trends are not available however as rates for the 2014 data were not published.

Annual Totals (and rate per 100,000#), notification rate of vaccine preventable diseases, 2014

Mildura 162 (rate not available)

Victoria 22,039

\*Notes for interpreting data:

- Data presented in this publication relate to notifications received by the department and do not necessarily reflect the true incidence of the disease.
- Data are presented by residential location and do not necessarily indicate where the infection was acquired.

# Rate per 100,000 for the 12 month period 11-May-2016 to 10-May-2017 calculated using ABS 2011 estimated resident population (51,848).

#### 1.177 **Happy and Healthy** Children have a healthy childhood, Proportion of children who are fully vaccinated at 12–15 months, 2014/2015

Data drawn from the Australian Childhood Immunisation Registry (ACIR) and published on VCAMS for the 2014/2015 and 2012/ 2013 reporting periods reveal that, for both time periods, the Mildura LGA has a lesser proportion to children aged 12-15 months immunised than their Victorian peers. Further the proportion of Mildura LGA 12-15 month olds fully vaccinated decreased between the reporting periods from 89.8% in 2012/2013 to 89.3% in 2014/2015.

#### 1.179 **1.3.5.2** Immunisation coverage rate at school entry Australian Childhood Immunisation Register (ACIR) Department of Health Australian Government (LGA)

Vaccination rates at 60-63 months (5 years), as documented below, give an indication of immunisation coverage rate at school entry. The following data is collected by the Australian Immunisation Register (AIR) and is based on the latest annualised quarterly report on childhood immunisation coverage for the June 2016, September 2016, December 2016 and March 2017 assessment quarters. These figures indicate that children aged 60-63 months in the Mildura LGA are outperforming their Victorian peers in immunisation rates with 94.54% immunised compared to 93.77% at the state level.

1.180 **Health** Immunisation cover, Percentage of Children Immunised (%), 2015/16, Australian Immunisation Register, Department of Human Services, (2017) (postcode) TL  
(Section 4.2 2012 Social Indicators Report)

This data builds on data previously reported in the 2012 Social Indicators Report in presenting the percentage of children immunised according to postcode areas. Importantly **NP** refers to 'Not available for publication' and is recorded where the area has fewer than 26 registered children, or the number of children not fully immunised is between one and five inclusive. NOTE postcodes recording a NP entry are not shown in the graph below, they are shown in the ensuing tables.

The tables below reveal the highest immunisation rates at 12-15 months are for postcodes 3496 (Red Cliffs, Cardross, Werrimull, Meringur, Cullulleraine) at 93.3% and 3549 (Robinvale, Wemen, Tol Tol, Annuello, Bannerton) at 92.7%. The highest immunisation rates at 24-27 months are for postcodes 3505 (Merbein, Birdwoodton, Merbein South, Cabarita, Yelta) at 97.7% and 3501 (Nichols Point, Koorlong, Hattah, Mildura South) at 93.7%. Finally the highest immunisation rates at 60-63 months are for postcodes 3498 (Irymple) at 100.0% and 3496 (Red Cliffs, Cardross, Werrimull, Meringur, Cullulleraine) at 98.7%. It is important to note however that some smaller communities may have equally high or higher rates of immunisation yet are not published according to the rules mentioned above these postcodes include (3490 - Ouyen, Big Desert, Boinka, Kulwin, Mittyack and 3 others; 3494 - Nangiloc, Colignan, Carwarp, Iraak; 3507 – Walpeup; 3509 - Underbool, Linga; 3512 - Murrayville, Carina, Panitya; 2717 - Coomealla, Dareton; 2738 - Gol Gol, Mallee, Monak, Paringi, Trentham Cliffs; and 2739 - Buronga, Boeill Creek, Mourquong).

Percentage of Children Immunised at 1, 2 and 5 years (by postcode), 2015/2016,

## Domain 2: Victorians are safe and secure

### Outcome 2.1: Victorians live free from abuse and violence

## INDICATOR – Reduce prevalence and impact of abuse and neglect of children

The impact of child abuse can have life-long consequences and result in poorer mental and physical health. In Australia, child protection is the responsibility of state and territory departments in the community services sector. Concerns of suspected child abuse or neglect can be reported to the statutory child protection service by a family member, member of the public or a professional. Child protection intake services screen incoming reports to determine whether further action is required. Reports that are deemed to require further action and are classified as a 'child protection notification' are investigated.

A child protection notification is assessed by the Victorian Department of Health and Human Services to determine: whether it requires an investigation; whether it should be dealt with by other means, such as referral to other organisations or to family support services; or whether no further protective action is necessary or possible. After an investigation is finalised, a notification is classified as 'substantiated' or 'not substantiated'. A notification is substantiated where it is concluded after investigation that the child has been, is being or is likely to be, abused, neglected or otherwise harmed (DHHS, 2014 and DHHS, 2017a).

### 2.1 Child protection investigations completed (per 1,000 eligible population), 2014-2015, Client Relationship Information System (CRIS) and Client Relationship Information System for Service Providers (CRISSP)\* (LGA) TL / R

Child protection investigation is the process whereby child protection workers obtain more detailed information about a child who is the subject of a report, and make an assessment about the harm or degree of harm to the child and the child's protective needs. An investigation includes the interviewing or sighting of the subject child where it is practicable to do so. The eligible population is children aged 0–17.

Data drawn from the Department of Health and Human Services' Client Relationship Information System (CRIS)/ Client Relationship Information System for Service Providers (CRISSP) reveal the Mildura LGA has a rank of 7<sup>th</sup> of 79 LGAs for the number of child protection investigations completed per 1,000 child aged 0-17 years (36.9 compared to the Victorian rate of 19.4).

#### Child protection investigations completed per 1,000 eligible population, 2014-2015

Mildura 36.9

Victoria 19.4

Rank 7

\*The Client Relationship Information System (CRIS) and Client Relationship Information System for Service Providers (CRISSP) databases are live databases; that is, they are updated continuously. Some updating occurs retrospectively, and this is likely to introduce variation in data reported in different time periods, with recently reported data being particularly subject to upward revision.

Source: Client Relationship Information System (CRIS)/ Client Relationship Information System for Service Providers (CRISSP), Department of Health and Human Services, 2014–2015 <https://www2.health.vic.gov.au/about/reporting-planning-data/gis-and-planning-products/geographical-profiles> Accessed 13/06/2017

## 2.2 2.1.1.1 Rate of children who were the subject of child abuse and neglect substantiation, 2014-2015, Client Relationship Information System (CRIS) DHHS (LGA)

**Safe and Secure** Children and young people are safe in their own homes, Child Protection (abuse) substantiation\* per 1,000 children aged 0–17 years, 2014-2015, Client Relationship Information System, DHHS (LGA) TL/R

**Community safety** Child maltreatment, (rate of substantiated cases) *(Section 6.1 2012 Social Indicators Report)*

Child protection substantiations refer to child protection reports which were investigated and it was concluded that there was reasonable cause to believe that the child had been, was being, or was likely to be, abused, neglected or otherwise harmed. The eligible population is children aged 0–17. The Client Relationship Information System (CRIS) and Client Relationship Information System for Service Providers (CRISSP) databases are live databases; that is, they are updated continuously. Some updating occurs retrospectively, and this is likely to introduce variation in data reported in different time periods, with recently reported data being particularly subject to upward revision. For this reason the figures reported below may change.

Between 2010-2011 and 2014-2015 the Mildura LGA experienced increasing rates of child abuse substantiation from 13.2 per 1,000 children to 17.6 per 1,000 children. In both time periods the Mildura LGA was above their Victorian counterparts and in 2014-2015 were ranked 16<sup>th</sup> of the 79 Victorian LGAs.

\* more current data was requested from Department of Health and Human Services, this could not be provided at the LGA level but was provided for the Mallee region (see below).

As recently as 30<sup>th</sup> June 2017 there were 459 children on child protection orders in the Mallee (covering the four Mallee LGAs of Mildura, Swan Hill, Gannawarra and Buloke). Based on 2016 ABS Census of Population and Housing data there were 20,568 children aged 0-17 years in the Mallee Area indicating a rate of 22.3 children (per 1,000 children aged 0-17 years) on child protection orders for the Mallee Area.

Source: Internally produced DHHS Data for Aboriginal Children's Forum, pers comm.

Rates methodology: (Numerator – number of children aged 0-17 years on child protection orders in Mallee Area / Denominator – total number of children aged 0-17 years in Mallee Area) x 1,000

### 2.4 **Safe and Secure** Children and young people are safe in their own homes, Children in out of home care\* per 1,000 children aged 0–17 years, 2015, Department of Health and Human Services (LGA) TL

The rate of children in out of home care in the Mildura LGA increased between 2012 and 2015 for children aged 0-17 years in the Mildura LGA. At each reporting period Mildura LGA children were more likely than their Victorian peers to be in out of home care at a rate of 10.3 per 1,000 compared to 6.1 per 1,000 in 2015.

#### Children in out of home care (per 1,000 population), 2015

## Domain 2: Victorians are safe and secure

### Outcome 2.1: Victorians live free from abuse and violence

#### INDICATOR – Reduce prevalence and impact of family violence

*“Intimate partner violence was the second largest cause of the burden of disease for Australian females aged 20–34 years in 2010, and the 14th highest risk factor for all Australians” (DHHS, 2015)*

Family violence causes substantial physical and psychological harm, particularly to women and children. It can destroy families and undermine communities. People who experience family violence are at greater risk of mental health disorders and their health and wellbeing are likely to be affected in both the short- and long-term. Experiencing of family violence, including witnessing family violence, can have harmful effects on children’s and young peoples’ physical, cognitive, emotional, behavioural and social development (DHHS, 2017a).

Family Violence is defined in the *Victoria Police Code of Practice for Investigation of Family Violence*, in accordance with the Family Violence Protection Act (2008), as any behaviour, whether a criminal offence or not, that in any way controls or dominates a family member and causes them to feel fear for their own, or other family members’ safety or well-being. It includes violent, threatening, coercive or controlling behaviour that occurs in current or former family, domestic or intimate relationships. Family means any family or family-like relationship, including current and former intimate partners, relatives, child/parent, same-sex partners and carers.

#### 2.5 2.1.2.1 Rate of incidents of family violence recorded by police (per 1,000 population), Sept 2014–Oct 2015, Law Enforcement Assistance Program (LEAP) Victoria Police (LGA)

Drawing on data captured by Victoria Police for a 13 month period (September 2014 – October 2015) the Victorian Department of Health Mallee Area profiles identifies the rate of family violence incidents (per 1,000 population) occurring in the Mildura LGA as almost three times the Victorian rate at 30.9 compared to 12.4. With these rates the Mildura LGA is ranked 2<sup>nd</sup> of the 79 Victorian LGAs for family violence incidents. This trend is reinforced on review of Victoria Police data from 2009/2010 onwards presented in the table below and further mirrors the trend reported in the *2012 Social Indicators Report*.

Family violence incidents (per 1,000 population) Sept 2014–Oct 2015, Victoria Police (LGA) TL/R

Mildura 30.9

Victoria 12.4

Rank 2

2.6 **Community safety** Domestic violence, Rate of Family Incident Reports, (per 100,000 population), Victoria Police *Family Incident Reports 2008/09 - 2012/13*. (Section 6.1 2012 Social Indicators Report)

The table below confirms the heightened rates of family violence incidents occurring in the Mildura LGA. For example, in the 2012 Social Indicators Report for the Mildura LGA the 2007-2008 time period reveals there were 1,205.3 family violence incidents per 100,000 compared to 608.3 per 100,000 across Victoria. This rate increased to 1,578.7 per 100,000 compared to 658.4 per 100,000 across Victoria in 2009/2010, increased further to 1,976.0 per 100,000 compared to 894.6 per 100,000 across Victoria in 2011/2012, increased in 2012/2013 to 2,594.0 per 100,000 for the Mildura LGA compared to 1,065.4 across Victoria before declining slightly in 2013/2014 to 2,568.1 per 100,000 for the Mildura LGA compared to 1,129.2 per 100,000 across Victoria. Trend arrows (within table) indicate this movement.

The ensuing table also presents data confirming the incidence of family violence occurring in the presence of children is consistently twice the rate for the Mildura LGA when compared to their Victorian counterparts. For example, in 2013/2014 Mildura LGA children were present at family violence incidents at a rate of 823.8 per 100,000 compared to all Victorian children who were present at family violence incidents at a rate of 387.6 per 100,000. At each progressive time period the rates of family violence incidents where children were present was increasing, again trend arrows (within table) indicate this movement.

Rate of Family Violence incident reports (per 100,000 population), 2009/2010 – 2013/2014

	2009/10		2010/11		2011/12		2012/13		2013/14

2.7 Rate of 'definite' alcohol related family incidents<sup>#</sup> (per 10,000 population), 2011/12 to 2014/15, AODstats, Turning Point (LGA) TL

Compared to Victoria, Mildura LGA had a higher rate of definite alcohol related family violence incidents per 10,000 (44.9 versus 10.7) and this difference was consistently reported from 2011/12 to 2014/15. Compared to state averages, annual figures for 2011/12 to 2014/15 consistently show higher rates per population of both males and females who were affected family members in reported definite alcohol related family violence incidents, as well as higher rates of population in each age cohort who were affected family members in reported definite alcohol related family violence incidents.

Within the Mildura LGA population, the highest rate of affected family members in definite alcohol related family violence incidents was seen in females and in the 25-39 years age cohort followed by the 18-24 years cohort.

Rate of 'definite' alcohol related family incidents<sup>#</sup> (per 10,000 population), 2011/12 to 2014/15

Year	Location	Total	Male	Female	0-17	18-24	25-39	40 years +
2014/15	Mildura LGA	44.9	18.0	71.1	3.8	94.2	105.4	35.2
	Victoria	10.7	6.3	14.9	1.2	12.7	18.9	10.9

Figures are for affected family members in family incidents that were definitely alcohol related.

**2.8 Safe and Secure** Children and young people are safe in their own homes, Percentage of family violence incidents where children and young people aged 0–17 years are involved as other parties, 2014/2015, Crime Statistics Agency (LGA) TL

In contrast to data presented above for family violence occurring in the 'presence of children' the following measure presents data for family violence 'where children and young people are involved as other parties'. Drawing on data collated by the Crime Statistics Agency the Mildura LGA has a lesser proportion of children (aged 0-17 years) involved as other parties in family violence incidents than their Victorian peers (32.8% compared to 34.5%). However, for the Mildura LGA, this proportion has increased between the reporting periods from 29.3% in 2012/2013 to 32.8% in 2014/2015.

Percentage of family violence incidents where children and young people aged 0–17 years are involved as other parties, 2014/2015

Mildura 32.8%

Victoria 34.5%

Time Trend – increase in family violence incidents where children and young people were present between 2012/13 – 2014/15 ↑

Proportions Methodology: Numerator - Number of recorded family violence incidents where other parties are involved that are children and young people /

Denominator - Total number of recorded family violence incidents.

## 2.9 **Safe and Secure** Children and young people are safe in their own homes, Family Violence Assessments during Key Ages and Stages visits, 2014/2015, DET Maternal and Child Health 2014/2015 Data Report (LGA) TL

Data drawn from the 2014/2015 Maternal and Child Health Annual Report for the Mildura LGA reveals a decreasing proportion of Family Violence Assessments being undertaken during KAS Visits. For example, in only 20% of KAS visits in 2014/2015 were Family Violence Assessments conducted, compared to 25% at the Victoria level and a decline from 30% of Mildura LGA KAS Assessments in 2012/2013. The growing incidence of reported family violence indicates the increasing importance that these assessments are undertaken.

### Family Violence Assessments during Key Ages and Stages visits, 2014/2015

Mildura 20%

Victoria 25%

Time Trend – family violence assessments during Key Ages and Stages visits decreasing between– 2012/2013 - 2014/2015 ↓

## 2.10 **Safe and Secure** Children and young people are safe in their own homes, Safety Plans Completed during Key Ages and Stages visits, 2014/2015, DET Maternal and Child Health 2014/2015 Data Report (LGA) TL

Given the higher reported rates of family violence within the Mildura LGA greater than State level proportions of Safety Plans being completed during Key Ages and Stages could be considered an appropriate and positive response. However the number of these plans being completed during Key Ages and Stages visits declined between the reporting periods.

### Safety Plans Completed during Key Ages and Stages visits, 2014/2015

Mildura 0.8%

Victoria 0.5%

**2.11 Safe and Secure** Children and young people are safe in their own homes, Domestic / Family Violence Referrals during Key Ages and Stages visits, 2014/2015, DET Maternal and Child Health 2014/2015 Data Report (LGA) TL

As highlighted in the preceding measure an increase in Family Violence referrals during Key Ages and Stages Visits between 2012/2013 and 2014/2015 for Mildura LGA (from 1.3% of all referrals to 1.4% of all referrals) should be considered an appropriate and constructive response to other measures which would indicate that the incidence of / reporting of family violence is increasing across the Mildura LGA.

## Domain 2: Victorians are safe and secure

### Outcome 2.1: Victorians live free from abuse and violence

#### INDICATOR – Increase community safety

2.1.2 2.1.3.2 Rate of hospitalisations due to assault, 2011/12 to 2013/14, Victorian Admitted Episodes Database DHHS

Hospitalisations<sup>#</sup> for assault, maltreatment and neglect, (rate per 100,000 population), 2011/12 to 2013/14, Victorian Injury Surveillance Unit (VISU) (LGA) TL

Street and community violence impacts primarily on men. In 2012, Victorian men were around 90% more likely than women to have experienced physical assault in the previous 12 months. Males are also substantially more likely to be victims of assault, robbery and homicide. In most cases perpetrators are other males.

Over the period 2011/12 to 2013/14, there were 68 hospitalisations of Mildura LGA residents for injuries caused by an assault, maltreatment or neglect. The rate of hospitalisations per Mildura LGA population was lower than the Victoria average (43.4 versus 60.0).

Hospitalisations<sup>#</sup> for assault, maltreatment and neglect, (rate per 100,000 population), 2011/12 to 2013/14

Location	No.	2012 ERP	Rate*
Mildura LGA	68	52,204	43.4
Victoria**	10,123	5,628,348	60.0

#Does not include persons who were only treated in an emergency department and not admitted into the hospital

## 2.17 Proportion of Hospitalisations<sup>#</sup> for assault, neglect or maltreatment injuries - by self-reported Indigenous status, 2011/12 to 2013/14, Victorian Injury Surveillance Unit (LGA)

Over the period 2011/12 to 2013/14, there were 18 hospitalisations of Mildura LGA Indigenous residents for injuries from an assault, neglect or maltreatment, accounting for 26.9% of all Mildura LGA hospitalisations for this cause. This is significantly above the proportion of Mildura LGA residents who identify, through the 2011 and 2016 ABS Census of Population and Housing surveys, as Aboriginal and/or Torres Strait Islander (3.6% and 3.8% respectively).

Hospitalisations<sup>#</sup> for assault, neglect or maltreatment injuries - by self-reported Indigenous status, 2011/12 to 2013/14

Self-reported Indigenous status of patient	No. of hospitalisations	% of all hospitalisations
Indigenous - Aboriginal and/or Torres Strait Islander	18	26.9%
Not Indigenous - not Aboriginal or Torres Strait Islander	49	73.1%
Total	67	100.0%

# Does not include persons who were only treated in an emergency department and not admitted into the hospital

## 2.18 Rate of assault victims for assaults that occurred in high alcohol hours<sup>\*\*</sup> - time series (rate per 10,000 population), 2011/12 to 2014/15, AODstats, Turning Point

In 2014/15, compared to the Victorian average (10.0), Mildura LGA (9.2) had a slightly lower rate of victims of assaults that occurred in high alcohol hours (HAH). However, in each year from 2011/12 to 2013/14, Mildura LGA had a higher rate than the state average and this difference was owing to the notably higher rates of male victims. Figures from 2011/12 to 2014/15 indicate that:

- Mildura LGA residents aged 18 - 24 years were most likely to be victims of assaults that occurred in HAH compared to other age groups, and
- Mildura LGA males were much more likely to be victims of HAH assaults compared to females.

Rate of assault victims for assaults that occurred in high alcohol hours<sup>\*\*</sup> - time series (rate per 10,000 population), 2011/12 to 2014/15

Year	Location	Total	Male	Female	0-17	18-24	25-39	40 years +
2014/15	Mildura LGA	9.2	8.0	10.4	np	np	25.3	5.4
	Victoria	10.0	11.2	8.8	4.3	26.5	17.9	5.6

# High alcohol hour assaults (HAH) - Fridays or Saturdays between 8 pm and 6 am. Alcohol involvement was noted in 65% of these incidents.

## 2.19 2.1.3.3 Proportion of adults feeling safe walking down their street at night, 2014, Victorian Population Health Survey, DHHS (LGA)

Neighbourhoods perceived as safe foster community participation, encourage physical activity, community connectedness, and add to the health and wellbeing of local residents and visitors. Research demonstrates that built environment and neighbourhood design and maintenance, have a high impact on perceptions of safety. Perceptions of neighbourhood safety is a measure of the social capital of a community. Trust is considered to be the main component of social capital, and social capital is a necessary condition for social integration, economic efficiency and democratic stability (DHHS, 2017a).

Trust has been defined as a set of socially learnt and confirmed expectations that people have of each other, of the organisations and institutions in which they live, and of the natural and moral social orders that set the fundamental understandings for their lives. 'Social trust' refers to trust among casual acquaintances or strangers in everyday social interaction, while 'civic trust' refers to trust in public institutions and the respect that citizens are accorded in their relationships with those institutions. Trust is essential within social systems to enable cooperative and altruistic behaviours that enhance collective wellbeing and the attainment of collective goals for example trust in our civic institutions, such as our healthcare system, and the people who run them is essential in order to maximise an individual's health and wellbeing. (DHHS, 2017a).

Whether individuals take up opportunities for social interaction and community engagement is likely to depend on the level and extent of both social and civic trust. The Victorian Population Health Survey asks four questions related to this: two on social trust and two on civic trust. Social trust was measured by asking survey respondents the following two questions: 'Do you agree that most people can be trusted?' and 'Do you feel safe walking alone down your street after dark?' (DHHS, 2017a).

The key findings from the 2014 Victorian Population Health Survey included the following:

- low social and civic trust is strongly associated with poor mental and physical health.
- social and civic trust declines with declining socioeconomic status.
- communities that are high in income inequality are low in social and civic trust, with income inequality preceding the decline in trust. This provides evidence for a direct causal link between income inequality and low levels of social and civic trust.

The 2014 Victorian Population Health Survey reveals Mildura LGA residents feel 'safe walking alone down their street at night' slightly less than their Victorian counterparts (59.9% versus 60.8%). Positively however the 'gap' in perceptions of safety has decreased since the 2011 VPHS where results revealed only 56.5% of Mildura LGA residents felt 'safe walking alone down their street at night' compared to 61.2% of their Victorian counterparts.

Proportion of adults feeling safe walking alone down their street at night (yes, definitely), 2014

Mildura 59.9%

Victoria 60.8%

Time Trend – increasing proportion of the Mildura LGA feeling safe walking along at night between the 2011 and 2014 VPHS reporting periods ↑

Proportion of adults feeling safe walking alone down their street at night (yes, definitely), 2011

Mildura 56.5%

Victoria 61.2%

Rank 68

## 2.20 **Safe and Secure** Children and young people are safe in their community, Perceptions of safety - walking alone during the day, 2015, VicHealth Indicators Survey

Neighbourhood safety and security are important determinants of people's health and wellbeing. When individuals feel safe within their communities, they are more likely to connect with friends, engage with other community members and experience greater levels of trust and social connection. When individuals perceive their neighbourhoods to be unsafe, they experience higher levels of anxiety and interactions between members of the community become more limited, placing them at risk of social isolation and mental illness.

Within the VicHealth Indicators Survey two indicators relating to perceptions of safety are presented: perception of safety while walking alone during the day and perception of safety while walking alone after dark. The indicators are measured on a 5-point Likert Scale ranging from 'Very safe' to 'Very unsafe'. The 'perception of safety while walking alone after dark' question has also been used in the Victorian Population Health Survey as a measure of trust and social cohesion.

In keeping with the VPHS findings Mildura LGA residents felt less safe than their Victorian peers 'walking along after dark' (47.5% versus 55.1%). Similarly Mildura LGA residents felt less safe than their Victorian peers 'walking alone during the day' (90.4% versus 92.5%). For both measures feelings of safety within the Mildura LGA decreased between the 2011 and 2015 reporting periods.

Perceptions of safety - walking alone during the day, 2015

Crime impacts personal and community safety, wellbeing, security, the attractiveness of an area for recreation, and on general amenity. The incidence of crime is both a cause and symptom of low quality of life, and is associated with poverty and exclusion (DHHS, 2017a).

The following data regarding crime offence rates (for crimes against property, person and drug offences at the Victorian, LGA and postcode levels) is drawn from the Crime Statistics Agency’s *Crime by Location* tool.

The Crime Statistics Agency (CSA) presents statistics about the characteristics of crime recorded on the Victoria Police Law Enforcement Assistance Program (LEAP). Victoria Police provides this information to the CSA 18 days after the reference period. As the LEAP database is a live operational data system and updated regularly, the data presented reflects only the information in the database at the date and time of extraction. This means that as additional quarters of data are released by the CSA, the data relating to previous periods may change as data are updated in LEAP, investigations progress and cases are completed by Victoria Police.

Prior to September 2014 Victorian crime statistics were published by the Corporate Statistics Unit of Victoria Police and such data, as accessed from the *Victoria Police Crime Statistics publications*, cannot be compared to that presented by CSA due to changes in offence classifications and counting rules. However, all data presented in the CSAs

Crime by Location tool, regardless of date range is comparable to more recent data because it is 'back cast' applying the CSAs revised classification and counting systems. As such all data presented below is comparable and provides an accurate indication of change in offence rates over the reported periods.

#### 2.24 **Community safety** Crime against property (per 100,000 population), 2016/2017, Crime Statistics Agency (LGA & postcode) (*Section 6.2 2012 Social Indicators Report*)

Review of Crime Statistics Agency data relating to crimes against property for the Mildura LGA reveals that whilst Mildura LGA remains above the Victoria rates for crime over both the 2012/2013 and 2016/2017 reporting periods the rate of crimes against property had decreased between 2012/2013 and 2016/2017.

Review of postcode level data indicates that for both the 2012/2013 and 2016/2017 reporting periods the Mildura postcode (3500) had the highest rate of offences of crimes against property, for both periods above the Mildura LGA level, whilst the lowest rate of offence was in Walpeup in both 2012/2013 and 2016/2017.

Due to the change in data source between this report (Crime Statistics Agency) and the *2012 Social Indicators Report* (Victoria Police) the report findings cannot be compared, for this reason the 2012/2013 data in this report was also analysed to provide offence rates and enable time trend comparisons.

## 2.25 **Community safety** Crime against person (per 100,000 population), 2016/2017, Crime Statistics Agency (LGA & postcode) TL *(Section 6.3 2012 Social Indicators Report)*

Review of Crime Statistics Agency data relating to crimes against the person for the Mildura LGA reveals that Mildura LGA continues to remain above the Victoria rates for crime over both the 2012/2013 and 2016/2017 reporting periods and further that rates of crime against the person had increased between 2012/2013 and 2016/2017.

Review of postcode level data indicates that for both the 2012/2013 and 2016/2017 reporting periods the Mildura postcode (3500) had the highest rate of offences of crimes against the person, for both periods above the Mildura LGA level, whilst the lowest rate of offence was in Underbool in 2012/2013 and Walpeup in 2016/2017 – both recording zero offences in the respective time periods.

Due to the change in data source between this report (Crime Statistics Agency) and the 2012 Social Indicators Report (Victoria Police) the report findings cannot be compared, for this reason the 2012/2013 data in this report was also analysed to provide offence rates and enable time trend comparisons.

## 2.26 Drug offences (per 100,000 population), Victoria Police, 2016/2017, Crime Statistics Agency (LGA)

Review of Crime Statistics Agency data relating to drug offences for the Mildura LGA reveals that Mildura LGA continues to remain above the Victoria rates for drug offences over both the 2012/2013 and 2016/2017 reporting periods and further that rates of drug offences had increased between 2012/2013 and 2016/2017.

Review of postcode level data for drug offences reveals some interesting results. For the 2012/2013 reporting period the highest rate (per 100,000) of drug offences was the Colignan / Nangiloc postcode (1,098.9), followed by the Underbool postcode (990.1) however in both instances small population sizes impact on these rates. The highest number of offences were in the Mildura postcode with 262 drug offences. In the 2016/2017 reporting period highest rate of drug offences was in the Irymple postcode (882.6 per 100,000 population) followed by the Mildura postcode (827.8). The lowest rate of offence was in Carina & Murrayville in 2012/2013 and Walpeup in 2016/2017 – both recording zero offences in the respective time periods.

## Domain 2: Victorians are safe and secure

### Outcome 2.2: Victorians have suitable and stable housing

#### INDICATOR – Decrease homelessness

Adequate housing is considered to be housing that meets peoples essential needs for shelter, security and privacy. Shelter is recognised throughout the world as a basic human right. Homelessness is one of the most potent examples of disadvantage in the community, and one of the most important markers of social exclusion (DHHS, 2017a).

#### 2.30 2.2.1.1 Proportion of people who meet the statistical definition of homelessness, 2011, Census of Population and Housing ABS (SA1, SA2, LGA)

2011 Census data analysed by the Murray Primary Health Network indicates 0.50% of the Mildura LGA population is, by definition, homeless compared to a lesser 0.43% of Victorians. At the time of finalising this Report (November 2017) data at this level had not yet been released from the 2016 Census of Population and Housing.

##### Homelessness, 2011

Mildura 0.50%

Victoria 0.43%

	Persons who are in improvised dwellings, tents or sleeping out	Persons in supported accommodation for the homeless	Persons staying temporarily with other households	Persons staying in boarding houses	Persons in other temporary lodgings	Persons living in 'severely' crowded dwellings	All homeless persons	Homeless %
Mildura	22	105	50	30	0	50	257	0.50
Victoria	1,091	7,842	3,324	4,395	97	6,024	22,773	0.43

## Domain 3: Victorians have the capabilities to participate

### Outcome 3.1: Victorians participate in learning and education

#### INDICATOR – Decrease developmental vulnerability

3.1 **3.1.1.1** Proportion of children at school entry who are developmentally vulnerable on one or more domains of the Australian Early Development Census, AEDC  
Commonwealth Department of Education and Training (LGA) TL

Supporting children's optimal physical, emotional and social health in the early years has long lasting positive effects on their health, social and emotional wellbeing and achievements throughout life. The benefits include increased school success; increased future productivity; and reduced cost of health and public services. Physical and social developmental deficits or delays may be more difficult to address as children grow older. Children from disadvantaged backgrounds are more at risk of poorer development and evidence demonstrates the differences between children from disadvantaged backgrounds and other children that emerge early in life (DHHS, 2017a).

The AEDC is a population measure, i.e. a Census of children's development as they enter school. The AEDC measures five domains of early childhood development: social competence, emotional maturity, language and cognitive skills, communication skills and general knowledge, and physical health and wellbeing. These five domains are closely linked to the predictors of good adult health, education and social outcomes. Teachers complete AEDC checklists for children in their first year of formal schooling where their development is rated as being on track, at risk or vulnerable. Children are considered:

- Developmentally 'on track' if they score above the 25th percentile (in the top 75%) of the national population,
- Developmentally 'at risk' if they score between the 10th and the 25<sup>th</sup> percentile of the national population,
- Developmentally 'vulnerable' if they score below the 10th percentile (in the lowest 10%) of the national population.

In 2015 the AEDC was undertaken at the National level for the third time (with previous scans undertaken in 2009 and 2012 and known as the Australian Early Development Index).

At the national level analysis of AEDC data would indicate that the proportion of children developmentally vulnerable on one or more domains varies across population groups. Groups more likely to be developmentally vulnerable included boys (30%), children living in the most socioeconomically disadvantaged areas (32%), those with a language background other than English (32%), Indigenous children (47%), and those living in Very remote areas (47%) (AIHW, 2012). Additionally children who did not attend preschool in the year before school were found to be more developmentally vulnerable than children who did (DEECD, 2013).

Based on 2015 AEDC data 22.3% children in their first year of school in the Mildura LGA were developmentally vulnerable on one or more domains, a greater proportion than their Victorian peers (19.9%).

### 3.2 Proportion of children developmentally vulnerable on two or more domains, Australian Early Development Census 2015 (LGA) TL

In 2015 10.4% of children in their first year of school in Mildura LGA were developmentally vulnerable in two or more domains. These figures had improved significantly since 2012 when 13.4% of the children were vulnerable in two or more domains. Over both time periods Mildura LGA children were faring worse than their Victorian counterparts, although the 'gap' had decreased.

### 3.3 **Developing Well** Children are developing well by age six (AEDC), Physical Health and Wellbeing, 2015, Australian Early Development Census (LGA) TL

For the following measures the figures presented are for those children not considered developmentally 'vulnerable' (those scoring below the 10th percentile [in the lowest 10%] of the national population) i.e. for those children who are either developmentally 'on track' or developmentally 'at risk'. This mirrors the reporting of this measure in *The 2014 State of Mildura Rural City's Children* report.

Physical Health and Wellbeing (proportion of children NOT developmentally vulnerable), 2015

Mildura LGA 91.2%

Victoria 92.1%

Time Trend – Mildura LGA experienced a significant decrease in developmental vulnerability between 2012-2015 ↑

Physical Health and Wellbeing (proportion of children NOT developmentally vulnerable), 2012

Mildura 88.1%

Victoria 92.2%

What does this mean for Mildura LGA children?

In 2015 8.8% of children (62 children) in their first year of school were 'developmentally vulnerable' in the following three sub-domains:

- Physical readiness for school day - Have at least sometimes experienced coming unprepared for school by being dressed inappropriately, coming to school hungry or tired - 13.7% of Mildura LGA children experienced concerns.
- Physical independence - Range from those who have not developed one of the three skills (independence, handedness, coordination), to those who have not developed any of these skills - 9.1% of Mildura LGA children experienced concerns.
- Gross and fine motor skills - Range from those who have an average ability to perform skills requiring gross and fine motor competence and good or average overall energy levels, to those who have poor fine and gross motor skills, poor overall energy levels and physical skills - 6.1% of Mildura LGA children experienced concerns.

Social Competence, percentage of children NOT developmentally vulnerable, 2012

Mildura 89.5%

Victoria 91.9%

What does this mean for Mildura LGA children?

In 2015 9.7% of children (68 children) in their first year of school were ‘developmentally vulnerable’ in the following areas:

- Overall social competence - Have average to poor overall social skills, low self-confidence and are rarely able to play with various children and interact cooperatively.
- Responsibility and respect - Only sometimes or never accept responsibility for actions, show respect for others and for property, demonstrate self-control, and are rarely able to follow rules and take care of materials.
- Approaches to learning - Only sometimes or never work neatly, independently, are rarely able to solve problems, follow class routines and do not easily adjust to changes in routines.
- Readiness to explore new things - Only sometimes or never show curiosity about the world, and are rarely eager to explore new books, toys or unfamiliar objects and games.

### 3.5 **Developing Well** Children are developing well by age six (AEDC), Emotional Maturity, 2015, Australian Early Development Census (LGA) TL

Emotional Maturity, percentage of children NOT developmentally vulnerable, 2015

Mildura 91.3%

Victoria 92.0%

Time Trend – Mildura LGA despite increasing levels of emotional maturity there was no significant change between 2012-2015 ↓

Emotional Maturity, percentage of children NOT developmentally vulnerable, 2012

Mildura 92.2%

Victoria 92.8%

What does this mean for Mildura LGA children?

In 2015 8.7% of children (61 children) in their first year of school were 'developmentally vulnerable' in the following areas:

- Pro-social and helping behaviour - Never or almost never show most of the helping behaviours including helping someone hurt, sick or upset, offering to help spontaneously, and inviting others to join in.
- Anxious and fearful behaviour - Often show most of the anxious behaviours; are worried, unhappy, nervous, sad or excessively shy, indecisive; and are upset when left at school.
- Aggressive behaviour - Often show most of the aggressive behaviours; they get into physical fights, kick or bite others, take other people's things, are disobedient or have temper tantrums.
- Hyperactivity and inattention - Often show most of the hyperactive behaviours; they could be restless, distractible, impulsive; they fidget and have difficulty settling to activities.

Victoria 93.9%

What does this mean for Mildura LGA children?

In 2015 8.1% of children (57 children) in their first year of school were 'developmentally vulnerable' in the following areas:

- Basic literacy - Do not have most of the basic literacy skills; have problems with identifying letters or attaching sounds to them, rhyming, may not know the writing directions and how to write their own name.

- Interest in literacy/numeracy and memory - May not show interest in books and reading, or maths and number games, or both, and may have difficulty remembering things.
- Advanced literacy - Have only up to one of the advanced literacy skills; cannot read or write simple words or sentences, and rarely write voluntarily.
- Basic numeracy - Have marked difficulty with numbers, cannot count, compare or recognise numbers, may not be able to name all the shapes and may have difficulty with time concepts.

### 3.10 **Developing Well** Children and parents are involved in playgroups, Mildura Rural City Council (township)

Playgroups provide valuable opportunities for children to learn and develop through play. Playgroups foster and develop children's language and motor skills, expose children to sensory experiences and enhance social skills. Playgroups and parent groups also create opportunities for parents to meet in a safe and supportive environment and learn new skills, develop social networks and build linkages to other services. Many Victorian families participate in community playgroups that are self-managed by the parents and caregivers who attend the playgroup. New parents often attend parent groups facilitated by their local maternal and child health service. Many of these new parent groups later evolve into self-sustaining social networks and/or community playgroups.

Research indicates that disadvantaged and vulnerable families are less likely to participate in playgroups including community members who are Indigenous, culturally and linguistically diverse, recently arrived, socio-economically disadvantaged and affected by disability. Supported playgroups and parent groups (SPPI) are facilitated or led by an appropriately qualified worker and are targeted at disadvantaged families who are less likely to attend a community group.

There is a growing body of evidence that participation in a Supported Playgroup run by a skilled and qualified worker has a positive impact on children's learning and social and emotional development. The findings of the Early Home Learning Study (2009-2012), and the *smalltalk* program developed as part of this study, demonstrated that it was possible to enhance the role of parents as first teachers and improve the quality and frequency of the parent-child interactions that are known to improve children's learning outcomes. Supported Playgroups also provide opportunities for parents to learn about relevant local services and to meet with other parents for emotional support and friendship and to build social support networks in the communities in which they live.

As a result of the growing evidence base the Victorian Department of Education and Training has invested in Supported Playgroups for families experiencing disadvantage to assist parents to develop the skills and confidence to support their children's learning and development. Smalltalk Supported Playgroups funded by the Department are required to deliver *smalltalk* to all participating families. *Smalltalk* is an evidence-based program that aims to introduce parents to a small number of parenting essentials that lead to optimal child outcomes, help parents become aware of the importance of their interactions with their child, and increase the number and type of situations in which they engage in quality interactions <http://www.education.vic.gov.au/about/programs/health/Pages/supportedplaygroups.aspx> accessed 30/05/2017.

At the time of writing this report there were as many as 20 playgroups operating across the Mildura LGA. Four (4) of these were community playgroups delivered by families themselves (Caterpillars Playgroup, Mulberry Tree Playgroup, Red Cliffs Community Playgroup and Sacred Heart Playgroup), others were facilitated playgroups delivered specifically to certain community groups by community based organisations. For example Mallee District Aboriginal Services delivers three (3) playgroups (Mums and Bubs, Goannas [co-delivered with MFC] and Ranfurly playgroup), Mallee Family Care delivers six (6) playgroups (FOODcents, Red Cliffs TLC, Merbein TLC, Mildura Community Playschool, Beyond the Rainbow, myTime Group), Zoe Support delivers three (3) playgroups (Little Peoples, Zoe Support and Cupcakes) and Sunraysia Mallee Ethnic Communities Council delivers two (2) playgroups (Harmony playgroup and Rhythm and Rhymes). The third playgroup 'form' were dedicated supported playgroups funded by DET and delivered by a qualified worker. Mildura Rural City Council delivers two (2) supported playgroups which feature the *smalltalk* program (one into the TLC – 'Shooting Stars' and one into Sunraysia Community Health Services – 'Kaleidoscope'). Mildura Rural City Council also co-delivers a third playgroup into SMECC – Harmony playgroup, already counted above.

RETIRED **Education** Playgroup participation, Number of Children Attending Mildura RCC Playgroups, 2011-2012, Mildura Rural City Council records (LGA)

3.11 **Engaged, Learning, Achieving** Children are participating in kindergarten, Kindergarten participation in the first year of enrolments, 2015, Children's Services On Line [CHISOL], DET (LGA) TL

Participation in quality early childhood education has substantial positive effects on children's social and cognitive development and school readiness. This has been shown to be especially so for children from disadvantaged families. Benefits from participation include better intellectual development and independence, sociability and concentration, cognitive development in the short term and preparation for success in school. Research by the Melbourne Institute of Applied Economic and Social Research using the Longitudinal Survey of Australian Children (LSAC) demonstrates the advantage that pre-school attendance has on later NAPLAN results. After controlling for socio-demographic characteristics in Australian children, a causal effect between pre-school attendance and Year 3 NAPLAN outcomes remains across all domains (numeracy, reading, spelling, writing, grammar and punctuation). This 'pre-school advantage' is equivalent to 10 to 15 NAPLAN points or the equivalent of 15 to 20 weeks of schooling at the Year 3 level (DEECD, 2013).

#### Kindergarten participation in the first year of enrolments, 2015

Mildura 99.0%

Victoria 98.1%

Rank 34

Time Trend - Mildura LGA increasing rates of kindergarten participation between 2012\* and 2015 ↑

#### Kindergarten participation in the first year of enrolments, 2012

Mildura 98.7%

Victoria 98.0%

Proportions methodology: Numerator - Number of first year enrolments in kindergarten / Denominator - Number of 3 year old children based on the previous year's estimated resident population

\*Note an improvement in kindergarten data collection from 2014 onwards led to a change in methodology for calculating this indicator. The impact of this change is minor and does not prevent the values being compared over time, when it is understood that an improvement in the quality of the indicator drives part of the difference between values in 2013 and 2014. The data quality improvements were around

- Identifying duplicate enrolments
- Changing the LGA breakdowns to relate to the child's residence rather than the location of the kindergarten service.

Victoria 24.6%

Rank 7

Proportions Methodology: Numerator - number of children attending kindergarten whose placement attracted a kindergarten fee subsidy / Denominator - number of kindergarten enrolments

\*Note an improvement in kindergarten data collection from 2014 onwards led to a change in methodology for calculating this indicator. The impact of this change is minor and does not prevent the values being compared over time, when it is understood that an improvement in the quality of the indicator drives part of the difference between values in 2013 and 2014. The data quality improvements were around

- Identifying duplicate enrolments
- Changing the LGA breakdowns to relate to the child's residence rather than the location of the kindergarten service.

**Engaged, Learning, Achieving** Services enable participation in pre-school, National Quality Standard Assessment and Rating (Kindergarten Services assessed as 'meeting' or 'exceeding'), 2017, Australian Children's Education and Care Quality Authority, (LGA) TL

The National Quality Framework (NQF) was established in 2012 and applies to most long day care, family day care, preschool/kindergarten and outside school hours care services. The National Quality Standard (NQS) is a key aspect of the framework and sets a national benchmark for all Australian services it covers. The seven quality areas covered by the NQS are:

1. Educational program and practice,
2. Children's health and safety,
3. Physical environment,
4. Staffing arrangements,
5. Relationships with children,
6. Collaborative partnerships with families and communities and
7. Leadership and service management.

Services covered by the National Quality Framework are assessed and rated against each of these seven Quality Areas. The ratings of assessed services are available on the Australian Children's Education and Care Quality Authority and MyChild websites. The rating levels for each Quality Area are:

- Exceeding National Quality Standard
- Meeting National Quality Standard
- Working Towards National Quality Standard
- Significant Improvement Required

An additional rating of 'Excellent' was introduced in 2013. Under the National Quality Framework, the Excellent rating can only be awarded by ACECQA. Only those service providers with a service rated Exceeding National Quality Standard can apply for the Excellent rating.

The *2014 State of Mildura Rural City's Children and Young People Report* presented assessment and rating data for the third quarter of 2013. At that time of the report 14 Pre-schools were providing a state-funded kindergarten program across the LGA (including the Murrayville and Underbool integrated services), of these eight were 'Provisional – Not Yet Assessed under the National Quality Framework', the remaining six received Overall Ratings of Meeting (4) or Exceeding (2) the National Quality Standard. Of the Pre-school services assessed across the Mildura LGA 100% were meeting or Exceeding the NQS compared to their Victorian (77%) and Australian (58%) counterparts at the time.

Review of NQS assessments and ratings for this report were the most current available at the time of writing and drew on data from the Australian Children's Education and Care Quality Authority and MyChild websites. Data revealed 3,131 (or 82.7%) of a total of 3,788 services providing pre-school in Victoria were rated as either 'meeting', 'exceeding' or 'excellent'. Nationally 9,934 (or 72.7%) of a total of 13,663 services providing pre-school were rated as either 'meeting', 'exceeding' or 'excellent'.

Across the Mildura LGA a total of 20 services were providing a state-funded kindergarten program. Of these 20 services 18 had been assessed (with the Murrayville and Underbool services considered 'provisional – not yet assessed'). Of 18 assessed services providing a state-funded kindergarten program 15 (or 83.3%) were rated as 'exceeding' or 'meeting', 3 services (16.6%) were assessed as working towards.

In summary the number of services offering a state-funded kindergarten program in the Mildura LGA had grown from 14 services in 2013 to 20 services in 2017 and the number of 'assessed' services had increased from six in 2013 to 18 services in 2017. Review of the 2017 NQS assessment and rating data revealed that the proportion of assessed services 'meeting' or 'exceeding' the NQS had decreased over the reporting periods (from 100.0% to 83.3%). However, significantly, the actual number of services offering a state-funded kindergarten program assessed as 'meeting' or 'exceeding' had increased from six in 2013 to 15 in 2017.

#### National Quality Standard Assessment and Rating (Kindergarten Services assessed as 'meeting' or 'exceeding'), 2017

## Domain 3: Victorians have the capabilities to participate

### Outcome 3.1: Victorians participate in learning and education

#### INDICATOR – Increase educational attainment

Meaningful and relevant education plays a fundamental role in both personal and social development. Levels of education influence employment opportunities and income, which in turn influence housing, transport, community participation and many other determinants of health. Education can support the development of interpersonal and life skills, understanding of others and can build relationships among individuals and groups (DHHS, 2017a).

The National Assessment Program – Literacy and Numeracy (NAPLAN) is an annual assessment for students in Years 3, 5, 7 and 9. The NAPLAN has been undertaken nationwide, every year, in the second full week in May since 2008. NAPLAN tests the sorts of skills that are essential for every child to progress through school and life in four areas (or 'domains'):

- reading
- writing
- language conventions (spelling, grammar and punctuation)
- numeracy <https://www.nap.edu.au/naplan>

#### 3.21 Proportion of year 9 students who attain national minimum standards in numeracy, 2015, NAPLAN, Department of Education and Early Childhood Development (LGA) TL / R

Whilst at each NAPLAN testing period a lesser proportion of Mildura LGA year 9 students were meeting national minimum standards in numeracy than their Victorian peers, over the 5 year period reported below, this proportion was steadily increasing for the Mildura LGA. This gradual improvement saw the Mildura LGA move from a rank of 70<sup>th</sup> (of 79 LGAs) in 2011 to a rank of 64<sup>th</sup> in 2014.

**3.29 Engaged, Learning, Achieving** Children and young people are achieving at school (NAPLAN), Proportion of students in Year 3 (5, 7 and 9) who meet or exceed the benchmarks for literacy, 2015, NAPLAN (LGA) TL

Importantly for all Year level NAPLAN measures for both literacy and numeracy reported, whilst Mildura LGA students remain below their Victorian peers in achievement levels, they show consistent improvement between the 2011 and 2015 reporting periods.

In 2015 a lesser proportion of Mildura LGA students in Year 3 were meeting or exceeding the NAPLAN benchmarks for literacy when compared to their Victorian peers (93.5% versus 95.5%). The proportion of Mildura LGA achieving 'meeting or exceeding' increased between the 2011 and 2015 reporting periods.

**3.31 Engaged, Learning, Achieving** Young people are engaged in learning or earning, Full-time participation in secondary school education at age 16, 2016, ABS Census of Population and Housing (2017) (LGA) TL

Review of 2011 and 2016 Census of Population and Housing data demonstrates a 'closing of the gap' between the full-time participation in education of 16 year olds in the Mildura LGA (89.0%) relative to their Victorian counterparts (91.8%), a 'gap' of less than 2 percentage points. In contrast in 2011 there was a 5.0 percentage point difference between full time students in Victoria compared to the Mildura LGA (89.6% to 84.6% respectively).

Note for readers comparing this report data to that presented in the *2014 State of Mildura Rural City's Children and Young People Report*, please be aware that the earlier report's figures were drawn from PHIDU and applied a different methodology.

RETIRED **Engaged, Learning, Achieving** Young people are engaged in learning or earning, Year 10–12 apparent retention rate, 2012, August School Census, Department of Education and Early Childhood Development (LGA) TL

3.32 **Engaged, Learning, Achieving** Young people are engaged in learning or earning, Proportion of young people aged 19 years who have attained Year 12 or equivalent, 2014, Skills Victoria and Victorian Curriculum and Assessment Authority, Department of Education and Early Childhood Development, (LGA) TL

Completing Year 12, or an equivalent vocational qualification, is a key factor in improving economic and social opportunities in life, encouraging lifelong learning and lifting national productivity. Nationally among young people aged 15 to 24 who had left school in 2011, 74% had completed Year 12—an increase from 70% in 2002.

In 2009, the Australian Government set a target for 90% of young people aged 20 to 24 to have attained Year 12 or a Certificate II or above by 2015, and Year 12 or a Certificate III or above by 2020. Across Australia in 2012, 86% of 20 to 24 year olds had completed Year 12 or at least Certificate II and 85% had completed Year 12 or at least Certificate III, which is an increase from 80% and 78% in 2003 respectively. However young people who have spent time in out-of-home care were about half as likely to complete Year 12 as the general population in 2009 (35% and 74% respectively) (AIHW, 2013).

By 2014 in the Mildura LGA 88.1% of young people aged 19 years had attained Year 12 or the equivalent, whilst this remained slightly below the Victorian proportion of 88.2% it was a 4.7 percentage point increase from the 2011 Mildura LGA proportion of 83.4%.

3.33 **Education** Incomplete education/training, Proportion of 17-24 Year Olds Neither Completing VCE nor undertaking Further Education and Training, 2011, ABS (SA1) TL  
(Table 8.3, 2012 Social Indicators Report)

As was undertaken in the 2012 Social Indicators Report this section examines the proportion of 17-24 aged persons who are neither in the process of completing Victorian Certificate of Education (VCE) nor acquiring any additional education or training (for example attending any other educational institution such as University or TAFE).

In comparing 2011 and 2016 Census data for this measure please note the methodology applied to the 2016 data analysis was for the proportion of 17-24 year olds in each 'attendance' category of ALL 17-24 year olds. It is thought the 2012 Social Indicators Report methodology was the proportion of 17-24 year olds in each 'attendance' category of the SUM of all three attendance categories. The 2016 methodology takes into account non-response.

Analysis of the 2016 Census of Population and Housing data for this measure reveals 25.1% of the Mildura LGA population were 'Not Attending (an educational institution) and Did Not Complete Year 12' compared to 11.6% of their Victorian peers and 20.6% of their Regional Victorian peers. Similarly 29.9% of the Mildura LGA population were 'Not Attending (an educational institution) but had Completed Year 12 or Equivalent' compared to 26.5% of their Victorian peers and 29.5% of their Regional Victorian peers. Significantly 35.1% of the Mildura LGA population were 'Attending School, University, TAFE, Other' compared to 55.7% of their Victorian peers and 42.2% of their Regional Victorian peers.

Within the Mildura LGA the SA1 Groupings with the highest proportion of 17-24 years olds 'Attending School, University, TAFE, Other' was Nichols Point (46.2%) and Irymple (40.5%) and the Grouping with the lowest proportion was Nangiloc / Colignan (13.3%).

Within the Mildura LGA the SA1 Grouping with the highest proportion of 17-24 years olds 'Not Attending (an educational institution) and Did Not Complete Year 12' was Merbein (30.7%) and Mildura North (27.0%) and the Grouping with the lowest proportion was Millewa and Mallee Track (0.0%).

Proportion of 17-24 Year Olds Neither Completing VCE nor undertaking Further Education and Training, 2016

SA1 Grouping*	Total population aged 17-24 years	Not Attending / Did Not Complete Year 12 (No.) %	Not Attending / Completed Year 12 or Equivalent (No.) %	Attending School, University, TAFE, Other (No.) %

Proportions Methodology: Numerator – Area Attending Status / Denominator – Area Total 17-24 year olds

\* refer to Appendix 2 for SA1 Grouping methodology, NOTE SA1 Groupings may or may not reflect SA2 areas.

\*\* Regional Victoria refers to the 2016 Census classification of 'Rest of Victoria' – which is the remaining area within the State of Victoria which does not fall within the Melbourne Greater Capital City Statistical Area geography

\*\*\* Melbourne refers to the Greater Capital City Statistical Area of Melbourne (GCCSA)

NOTE: Some cells in this table have been randomly adjusted to avoid the release of confidential data. No reliance should be placed on small cells.

NOTE: Not attending/did not complete year 12: these people didn't complete their school studies and are not currently a student.

NOTE: Not attending completed year 12: these people finished their schooling but are not currently a student.

NOTE: Attending school or university: these people are currently students at an educational facility (includes all forms i.e. full-time, part-time, full-time/part-time status not stated).

### 3.34 Proportion of school leavers enrolled in higher education, 2016, Public Health Information Development Unit (LGA) TL

Data presented in the Social Health Atlas of Australia collated by the Public Health Information Development Unit suggests only 9.8% (74) of Mildura LGA school leavers were enrolled in higher education (on school completion) compared to their Victorian peers (39.3%). A sharp decline from 20.4% in 2013.

#### School leavers enrolled in higher education, 2016

Mildura 9.8%

Victoria 39.3%

Time Trend declining rates of school leavers enrolled in higher education between 2016 and 2013 ↓

#### School leavers enrolled in higher education, 2013

Mildura 20.4%

Victoria 35.9%

Methodology: numerator – school leavers enrolled in higher education / denominator - persons aged 17 years, 2015

Source: Social Health Atlas of Australia, Victoria, Data by Local Government Area. Public Health Information Development Unit Published September 2017

<http://phidu.torrens.edu.au/social-health-atlases/data#social-health-atlases-of-australia-local-government-areas> Accessed: 20/10/2017

Local research, by the Northern Mallee Local Learning and Employment Network, suggests higher rates of University deferment in rural Australia (the likelihood of school leavers taking a 'gap' year) means there are greater proportions of school leavers enrolling in higher education than the Public Health Information Development Unit findings would suggest. Certainly research by the University of Melbourne suggests that 7 out of 10 students who defer do progress onto university.

Of the approximately 530 Yr 12 completers in the Mildura LGA in 2016 270 completed the On Track survey (51% of the Y12 completers). Of these 34.81% (94) were enrolled in a Bachelor Degree in 2017 and a further 44 had deferred. Applying the Melbourne University rule that 70% will continue onto University the following year, a further 30.8 students from the 2016 Year 12 completers will go to University (a total of 124.8). This increase means 46.22% of year 12 completers who complete the On Track survey will enrol in higher education (applying the same methodology to Victorian rates approximately 60.98% year 12 completers enrol in higher education). This methodology reveals a 'gap' of 14.75 percentage points between Mildura LGA and Victorian higher education enrolment rates. This is in contrast to the 'gap' suggested in the Public Health Information Development Unit data of 29.5 percentage points.

There are significantly different data methodologies applied to these divergent findings however. In the Public Health Information Development Unit measure the denominator is the total population of 17 year olds in the Mildura LGA, the numerator are those who have enrolled in higher education having completed school the immediate past year. In the On Track data the denominator for year 12 completers going onto higher education is the number of year 12 completers who responded to the On Track survey, and the numerator is both those who enrolled in higher education immediately after school completion and an applied ratio of a further 70% of those who deferred (based on studies conducted by the University of Melbourne which indicate that 7 out of 10 students who defer, progress onto university).

3.35 **Education** Overall education, Level of Schooling Attained by Residents over the age of 15, 2016, ABS Census of Population and Housing (2017) (LGA and SA1) TL **(Table 8.4, 2012 Social Indicators Report)**

In comparison to both Victoria (54.4%) and Regional Victoria (38.9%) the Mildura LGA (33.5%) has lower levels of attainment of 'Year 12 or equivalent' (down slightly from 33.6% in 2011, as reported in the *2012 Social Indicators Report*). Within the Mildura LGA the SA1 Grouping with the lowest level of attainment of 'Year 12 or equivalent' was Millewa (24.6%) and Ouyen / Walpeup 26.9%, by contrast the SA1 Groupings with the highest level of attainment of 'Year 12 or equivalent' was Nichols Point (42.5%) and Mildura South (35.5%).

Further analysis reveals both Victoria and the Mildura LGA have 1.1% of residents aged over 15 years who 'did not go to school', in contrast Regional Victoria reported only 0.5%. Within the Mildura LGA the SA1 Grouping with the lowest level of residents who 'did not go to school' were Nichols Point, Millewa, Nangiloc / Colignan and Mallee Track (all 0.0%), by contrast the SA1 Groupings with the highest level of residents who 'did not go to school' were Mildura North (1.5%) and Mildura South (1.3%).

### 3.36 Highest Year of School Completed by Indigenous Status, 2016, ABS Census of Population and Housing 2017 (LGA)

Analysis of 2016 ABS Census of Population and Housing data indicates of persons identifying as Indigenous and aged 15 years and over who are no longer attending primary or secondary school 22.3% completed Year 12 or equivalent compared to 38.2% of their Non-Indigenous counterparts. Of persons identifying as Indigenous and aged 15 years and over who are no longer attending primary or secondary school 0.7% indicated they 'did not go to school' compared to 1.2% of their Non-Indigenous counterparts. At the Mildura LGA level 34.8% of the population aged 15 years and over who are no longer attending primary or secondary school completed Year 12 or equivalent and 1.1% 'did not go to school'.

Proportions Methodology: Numerator – Indigenous status Highest Year of School Completed / Denominator – Indigenous status Total Persons (i.e. based on first cell 255/1,145=22.3%)

This table is based on place of usual residence.

\* Count of persons aged 15 years and over who are no longer attending primary or secondary school

(a) Comprises persons who identified themselves as being of 'Aboriginal', 'Torres Strait Islander' or 'Both Aboriginal and Torres Strait Islander' origin.

Please note that there are small random adjustments made to all cell values to protect the confidentiality of data. These adjustments may cause the sum of rows or columns to differ by small amounts from table totals.

### 3.37 People who left school at Year 10 or below, or did not go to school (ASR per 100), 2016, Public Health Information Development Unit (LGA) TL

Data indicates that 37.2% of the Mildura LGA population aged 15 years and over (in 2016) had left school at Year 10 or below, compared to the Victorian proportion of 26.0%.

People who left school at Year 10 or below, or did not go to school (ASR per 100)\*, 2016

Mildura 37.2

Victoria 26.0

Time Trend – between the 2011 and 2016 reporting periods there was a decreasing proportion of the Mildura LGA who had left school at year 10 or below ↓

People who left school at Year 10 or below, or did not go to school (ASR per 100)\*, 2011

Mildura 42.0

Victoria 29.4

\* The data comprise people who left school at Year 10 or below, or did not go to school, expressed as an indirectly standardised rate per 100 people aged 15 years and over (Usual Resident Population – 2011 Census), based on the Australian standard.

### 3.38 Proportion of persons who did not complete year 12, 2016, ABS Census of Population and Housing (LGA) TL / R

This measure reflects the percentage of people aged 15 years and over who either did not attend school, or who attended school but did not complete year 12. Both the 2016 and 2011 data reported here is drawn directly from the Census of Population and Housing data through TableBuilder, analysed according to the methodology stated below.

These results reveal a decreasing proportion of the Mildura LGA population (aged 15 years and over) who did not complete year 12 from 60.1% in 2011 to 54.7% in 2016. At both time periods the Mildura LGA had a higher proportion of the population who had not completed year 12 (or attended school) than did their Victoria counterparts.

Proportion of persons who did not complete year 12 (aged 15 years and over)\* Mildura LGA, 2016

Mildura **54.7%**

Victoria 37.4%

Time Trend - a decreasing proportion of the Mildura LGA population (aged 15 years and over) who did not complete year 12 from 60.1% in 2011 to 54.7% in 2016 ↓

Proportion of persons who did not complete year 12 (aged 15 years and over)\* Mildura LGA, 2011

Mildura **60.1%**

Victoria 42.1%

\* Includes all residents aged 15+ who answered the Census of Population and Housing question - 'Highest Year of School Completed' as 'Did not go to school', 'Year 8 or below', 'Year 9 or equivalent', 'Year 10 or equivalent' or 'Year 11 or equivalent'. Does not include 'Year 12 or equivalent', 'Not Stated' or 'Not applicable'

Proportions methodology: Numerator – number of people who did not complete year 12 (aged 15 years and over) / Denominator – total population aged 15 years and over

3.41 **Education** Overall education, Post-Schooling Qualifications, 2011, ABS Census of Population and Housing (SA1) TL *(Table 8.5: Post-Schooling Qualifications, 2011 Social Indicators Report)*

The share of Mildura LGA residents holding a Bachelor Degree level qualification has once again increased from 6.2% in 2011 to 7.2% in 2016 (this mirrors a 1.2% percentage increase between 2006 and 2011). Whilst the Mildura LGA remains below Melbourne (with Melbourne registering 16.3% of its residents with Bachelor Degree level qualifications), Regional Victoria (9.3%) and Victoria (14.7%). Trend arrows in the Mildura LGA row indicate movement from 2011 as reporting in the *2012 Social Indicators Report*.

Within the Mildura LGA the SA1 Grouping with the highest proportion of residents with a Bachelor Degree level qualification was Nichols Point (12.2%) followed by Mildura North (8.0%). The SA1 Grouping with the lowest proportion of residents with a Bachelor Degree level qualification was Nangiloc / Colignan (4.2%).

Proportions Methodology: Numerator – Area level of post schooling qualification / Denominator – Area ‘Total’ (sum of all qualification and ‘Not Applicable’)

\* refer to Appendix 2 for SA1 Grouping methodology, NOTE SA1 Groupings may or may not reflect SA2 areas.

\*\*Not applicable includes:

- Persons who have a qualification that is out of scope of this classification
- Persons with no qualification
- Persons still studying for a first qualification
- Persons aged under 15 years

\*\*\* Regional Victoria refers to the 2016 Census classification of ‘Rest of Victoria’ – which is the remaining area within the State of Victoria which does not fall within the Melbourne Greater Capital City Statistical Area geography

\*\*\*\* Melbourne refers to the Greater Capital City Statistical Area of Melbourne (GCCSA)

### 3.42 Percentage of persons who completed a higher education qualification, 2011, ABS Census of Population and Housing (LGA) TL / R

This measure is a reflection of the percentage of people aged 15 years and over who have attained a definitive higher education qualification, including: a post-graduate degree, a graduate diploma, a graduate certificate or a bachelor degree. People who have attained a diploma or an advanced diploma are not included, as these qualifications may have been obtained through the Vocational Education and Training (VET) sector. In the Mildura LGA 26.8% of residents aged 15 years and over had attained a definitive higher education qualification compared to 45.7% of their Victorian counterparts.

#### Percentage of persons who completed a higher education qualification, 2011

Mildura 26.8%

Victoria 45.7%

Rank 56

### 3.43 Type of Educational Institution Attending (Full/Part-Time Student Status by Age) by Indigenous Status by Sex, 2016, ABS Census of Population and Housing (2017) (LGA)

#### Type of Educational Institution Attending (Full/Part-Time Student Status by Age) by Indigenous Status by Sex, Mildura LGA, 2016

Review of the following table, which draws on 2016 Census data, suggests that at the tertiary level of study students aged 15-24 years are more likely to study full-time than students aged 25 years and over, who are more likely to engage in part-time studies.

Based on figures reported in the Mildura LGA 2016 ABS Census of Population and Housing *General Community Profile* at the time of the 2016 Census there were 1,268 persons in the Mildura LGA who identified as Aboriginal and/or Torres Strait Islander and a further 38,753 persons in the Mildura LGA who identified as non-Indigenous. Applying these population estimates the following proportions of people identifying as Indigenous and Non-Indigenous are participating in tertiary level studies:

- A total of 54 Aboriginal and/or Torres Strait Islander persons (4.3%) were attending a 'Technical or Further Educational Institution'
- By comparison a total of 937 non-Indigenous persons (2.4%) were attending a 'Technical or Further Educational Institution'
- A total of 23 Aboriginal and/or Torres Strait Islander persons (1.8%) were attending a 'University or other Tertiary Institution'
- By comparison a total of 912 non-Indigenous persons (2.4%) were attending a 'University or other Tertiary Institution'
- A total of 25 Aboriginal and/or Torres Strait Islander persons (2.0%) were attending an 'Other type of Educational Institution'
- By comparison a total of 298 non-Indigenous persons (0.8%) were attending a 'Other type of Educational Institution'
- A total of 146 Aboriginal and/or Torres Strait Islander persons (11.5%) were attending a 'Type of Educational Institution not stated'
- By comparison a total of 1,394 non-Indigenous persons (3.6%) were attending a 'Type of Educational Institution not stated'

Mildura LGA	Aboriginal and/or Torres Strait Islander(a)			Non-Indigenous			Indigenous status not stated			Total

Proportions Methodology: Numerator – Indigenous status by Educational Institution Attending status / Denominator – Indigenous status Total Persons by Educational Institution Attending status

This table is based on place of usual residence.

(a) Comprises persons who identified themselves as being of 'Aboriginal', 'Torres Strait Islander' or 'Both Aboriginal and Torres Strait Islander' origin.

(b) Includes TAFE colleges.

Please note that there are small random adjustments made to all cell values to protect the confidentiality of data. These adjustments may cause the sum of rows or columns to differ by small amounts from table totals.

### 3.44 Non-School Qualification: Level of Education by Indigenous Status, 2016, ABS Census of Population and Housing (2017) (LGA)

Coded using the Australian Standard Classification of Education (ASCED), Level of Education Classification this measure describes the level of a person's highest completed non-school qualification and is applicable to persons aged 15 years and over who stated they had completed a non-school qualification.

Of all Mildura LGA residents identifying as Aboriginal and/or Torres Strait Islander who reported holding a non-school qualification (527 persons):

- 3.0% (16) held a Postgraduate Degree, Graduate Diploma or Graduate Certificate Level qualification,
- 6.8% (36) held a Bachelor Degree qualification,
- 12.9% (68) held an Advanced Diploma or Diploma Level qualification,
- 39.8% (210) held a Certificate III & IV Level qualification,
- 8.0% (42) held a Certificate I & II Level qualification,
- 3.2% (17) held a Certificate Level, nfd qualification, and
- 25.8% (136) did not state their level of education.

Of all Mildura LGA residents identifying as Non-Indigenous who reported holding a non-school qualification (18,797 persons):

- 5.7% (1,072) held a Postgraduate Degree, Graduate Diploma or Graduate Certificate Level qualification,
- 17.9% (3,374) held a Bachelor Degree qualification,
- 16.0% (3,000) held an Advanced Diploma or Diploma Level qualification,
- 39.5% (7,427) held a Certificate III & IV Level qualification,
- 3.1% (579) held a Certificate I & II Level qualification,
- 4.0% (733) held a Certificate Level, nfd qualification, and
- 13.9% (2,610) did not state their level of education.

#### Non-School Qualification: Level of Education by Indigenous Status, Mildura LGA, 2016

Mildura LGA	Postgraduate Degree, Graduate Diploma and Graduate Certificate Level	Bachelor Degree Level	Advanced Diploma and Diploma Level	Certificate III & IV Level(c)	Certificate I & II Level(d)	Certificate Level, nfd	Level of education not stated(e)	Total

Proportions Methodology: Numerator – Indigenous status by level of Non-School Qualification status / Denominator – Indigenous status Total Persons by Non-School Qualification status

This table is based on place of usual residence.

(a) Excludes schooling up to Year 12.

(b) Excludes persons with a qualification out of the scope of the Australian Standard Classification of Education (ASCED).

(c) Includes 'Certificate III & IV Level, nfd'.

(d) Includes 'Certificate I & II Level, nfd'.

(e) Includes 'Level of education inadequately described'.

Please note that there are small random adjustments made to all cell values to protect the confidentiality of data. These adjustments may cause the sum of rows or columns to differ by small amounts from table totals.

### 3.45 Non-School Qualification: Field of Study by Sex, 2016, ABS Census of Population and Housing (2017) (LGA)

Analysis of 2016 ABS Census of Population and Housing data reveals some enduring gender differences within certain fields of study including Information Technology (with 80.0% of students male and 20.5% female), Engineering and Related Technologies (with 95.6% of students male and 4.4% female), Architecture and Building (with 95.4% of students male and 4.5% female), Agriculture, Environmental and Related Studies (with 80.3% of students male and 19.9% female), Health (with 18.6% of students male and 81.5% female) and Society and Culture (with 24.6% of students male and 75.3% female).

Gender aside the most popular field of study within the Mildura LGA were Engineering and Related Technologies (31.1%), Management and Commerce (12.8%), Society and Culture (10.3%), Health (9.8%) and Education (8.4%).

#### Non-School Qualification: Field of Study by Sex, Mildura LGA, 2016

Gender Proportions Methodology: Numerator – Gender by Field of Study status / Denominator – Total Persons by Field of Study status

Field of Study Proportions Methodology: Numerator – Total Persons in a Field of Study / Denominator – Total Persons in all Fields of Study (including inadequately described and not stated)

This table is based on place of usual residence.

(a) Excludes persons with a qualification out of the scope of the Australian Standard Classification of Education (ASCED).

Please note that there are small random adjustments made to all cell values to protect the confidentiality of data. These adjustments may cause the sum of rows or columns to differ by small amounts from table totals.

## Supporting all abilities and ages

### A.1 Core Activity Need for Assistance by Age, 2016, ABS Census of Population and Housing (2017) (LGA)

At each age cohort the Mildura LGA experienced higher proportions of the population reporting 'core activity need for assistance' than their Victorian counterparts.

#### Core Activity Need for Assistance by Age, Mildura LGA, 2016

	<i>Has need for assistance % (No.)</i>	<i>Does not have need for assistance</i>	<i>Need for assistance not stated</i>	<i>Total</i>
0-4 years	1.6% (53)	90.2% (3,034)	8.4% (281)	3,363
5-14 years	4.3% (294)	88.5% (6,076)	7.3% (498)	6,867
15-19 years	3.3% (116)	89.0% (3,132)	7.7% (271)	3,518
20-24 years	2.7% (86)	87.8% (2,767)	9.7% (306)	3,153
25-34 years	2.2% (142)	88.0% (5,752)	9.9% (647)	6,535
35-44 years	3.3% (203)	88.4% (5,451)	8.4% (517)	6,168
45-54 years	4.7% (333)	86.8% (6,143)	8.4% (601)	7,079
55-64 years	6.4% (455)	84.5% (6,009)	9.1% (649)	7,111
65-74 years	10.8% (591)	79.1% (4,344)	10.1% (555)	5,493
75-84 years	21.8% (692)	67.3% (2,132)	10.8% (341)	3,169
85 years and over	48.8% (692)	41.5% (589)	9.7% (138)	1,419
<b>Total</b>	<b>6.8% (3,644)</b>	<b>84.3% (45,429)</b>	<b>8.9% (4,799)</b>	<b>53,878</b>

#### Core Activity Need for Assistance by Age, Victoria, 2016

	<i>Has need for assistance % (No.)</i>	<i>Does not have need for assistance</i>	<i>Need for assistance not stated</i>	<i>Total</i>
0-4 years	1.1% (4,169)	92.5% (343,215)	6.4% (23,830)	371,220
5-14 years	3.3% (23,089)	91.3% (648,022)	5.4% (38,591)	709,702
15-19 years	2.5% (8,998)	91.9% (327,510)	5.6% (19,830)	356,340
20-24 years	1.8% (7,331)	91.5% (378,748)	6.7% (27,716)	413,792

55-64 years	5.6% (37,606)	87.7% (593,982)	6.8% (45,868)	677,453
65-74 years	9.1% (46,128)	83.6% (426,007)	7.4% (37,467)	509,599
75-84 years	21.3% (60,670)	70.4% (200,549)	8.3% (23,788)	285,006
85 years and over	47.0% (60,144)	42.5% (54,348)	10.5% (13,502)	127,993
<b>Total</b>	<b>5.1% (304,937)</b>	<b>88.1% (5,220,867)</b>	<b>6.8% (400,817)</b>	<b>5,926,624</b>

Source: 2016 ABS Census of Population and Housing, General Community Profile, Mildura LGA and Victoria

<http://www.abs.gov.au/websitedbs/D3310114.nsf/Home/2016%20Census%20Community%20Profiles> Accessed 27/06/2017

Proportions Methodology: numerator – age cohort ‘core activity need for assistance’ / denominator – age cohort total

This table is based on place of usual residence.

(a) A person's need for help or assistance in one or more of the three core activity areas of self-care, mobility and communication, because of a disability, long term health condition (lasting six months or more) or old age.

NOTE: there are small random adjustments made to all cell values to protect the confidentiality of data. These adjustments may cause the sum of rows or columns to differ by small amounts from table totals.

## A.2 Core Activity Need for Assistance, 2016, ABS Census of Population and Housing (2017) (LGA, SA2) TL

Mildura LGA residents had a total ‘need for assistance’ amongst 6.8% of the population compared to the Victorian total of 5.1%. Amongst the Mildura LGA SA2s the SA2 with the highest proportion of the population experiencing ‘core activity need for assistance’ was Mildura South (7.5%) followed by Mildura North (7.3%). The SA2 with the lowest proportion of population experiencing ‘core activity need for assistance’ was Irymple (4.8%).

### Core Activity Need for Assistance (has need for assistance), Mildura LGA, 2016

Mildura 6.8%

Victoria 5.1%

Time Trend – the proportion of the total Mildura LGA population with need for assistance with core activity increased between the 2011 and 2016 reporting periods ↑

### Core Activity Need for Assistance (has need for assistance), Mildura LGA, 2011

Mildura 6.3%

Victoria 5.0%

Rank 21

Source: 2016 ABS Census of Population and Housing, General Community Profile, Mildura LGA and Victoria

<http://www.abs.gov.au/websitedbs/D3310114.nsf/Home/2016%20Census%20Community%20Profiles> Accessed 27/06/2017

Rate Methodology (Has Need for Assistance): total number within age cohort with 'need for assistance' / total age cohort x 1,000 = crude rate per 1,000. For example: in the 0-4 years age group for Mildura LGA  $53/3,363 = 0.015759 \times 1,000 = 15.8$

Age-Adjusted Rate Methodology: crude rate for age cohort x Age Distribution of Standard Population = Age adjusted rate. For example: in the 0-4 years age group for Mildura  $15.8 \times 0.066056 = 1.04$

\* Age Distribution of Standard Population is based on the ABS data cube '[Standard Population for Use in Age-Standardisation Table](#)' within [Australian Demographic Statistics](#) (cat. no. 3101.0), starting with the release on 20 June 2013. See Appendix 2 for further details and methodological explanation.

This table is based on place of usual residence.

(a) A person's need for help or assistance in one or more of the three core activity areas of self-care, mobility and communication, because of a disability, long term health condition (lasting six months or more) or old age.

NOTE: there are small random adjustments made to all cell values to protect the confidentiality of data. These adjustments may cause the sum of rows or columns to differ by small amounts from table totals.

#### A.5 **Overview** Percentage of children aged 0–19 years (of all children aged 0–19 years) requiring core activities need for assistance, 2016, ABS Census of Population and Housing (2017) (LGA) TL

At both the 2011 and 2016 Census points the Mildura LGA had a higher proportion of children and young people aged 0-19 years requiring core activities need for assistance than their Victorian peers (in 2016 this was 3.4% versus 2.5%). The proportion increased between the 2011 and 2016 Census points.

##### Percentage of children aged 0–19 years (of all children aged 0–19 years) requiring core activities need for assistance, 2016

Mildura 3.4%

Victoria 2.5%

Time Trend – increasing proportion of children and young people aged 0-19 years requiring core activities need for assistance between the 2011 and 2016 Census reporting periods ↑

##### Percentage of children aged 0–19 years (of all children aged 0–19 years) requiring core activities need for assistance, 2011

Mildura 2.7%

Victoria 2.0%

Proportions Methodology: numerator – age cohort 0-19 years 'core activity need for assistance', denominator – age cohort 0-19 years total

A.6 **Health** Children with a disability, Proportion of Children Aged 0-9 with a Disability, 2016, ABS Census of Population and Housing 2017 (LGA and SA1) TL *(Table 4.9 2012 Social Indicators Report)*

Analysis of 2016 Census of Population and Housing data reveals an increase in the number of children aged 0-9 years with a disability in the Mildura LGA from 2.5% in 2011 to 2.9% in 2016. This was above both the Regional Victorian (2.6%) and Melbourne (2.0%) proportions. The SA1 Grouping with the highest proportion of children aged 0-9 years with a disability was Mildura North (3.7%) followed by Koorlong / Cardross (3.4%) a contrast to the highest 2011 SA1 Grouping of Nangiloc / Colignan (13.6%). The SA1 Grouping with the lowest proportion of children aged 0-9 years with a disability was Nichols Point, Millewa and Nangiloc / Colignan (all 0.0%).

Proportion of children aged 0-9 years with a disability, 2016

Proportions Methodology: Numerator – Area need for assistance status / Denominator – Area Total population

\* refer to Appendix 2 for SA1 Grouping methodology, NOTE SA1 Groupings may or may not reflect SA2 areas.

\*\* Core Activity Need for Assistance measures the number of people with a profound or severe disability. Where people with a profound or severe disability are defined as those people needing help or assistance in one or more of the three core activity areas of self-care, mobility and communication, because of a disability, long-term health condition (lasting six months or more) or old age.

\*\*\* Regional Victoria refers to the 2016 Census classification of 'Rest of Victoria' – which is the remaining area within the State of Victoria which does not fall within the Melbourne Greater Capital City Statistical Area geography

\*\*\*\* Melbourne refers to the Greater Capital City Statistical Area of Melbourne (GCCSA)

#### A.7 People of all ages with severe and profound disability living in the community, 2011, ABS Census of Population and Housing (LGA)

The percentage of people (all ages/aged 65+) in the Mildura LGA who have a profound or severe disability, and who live in the community, rather than in long-term residential care was higher, at 5.0% than their Victorian peers (4.0%), achieving the Mildura LGA a rank of 18<sup>th</sup> of the 79 Victorian LGAs.

##### People of all ages with severe and profound disability living in the community, 2011

Mildura 5.0%

Victoria 4.0%

Rank 18

#### A.8 People receiving disability services\* support per 1,000 population, 2014-2015, Disability National Minimum Dataset (NMDS), (LGA) TL/R

Within the Mildura LGA 11.0 people per 1,000 were receiving disability services support in 2014-2015 compared to 8.9 per 1,000 across Victoria. Mildura LGA was ranked 21<sup>st</sup> of the 79 LGAs on this measure.

##### People receiving disability services\* support (per 1,000 population), 2014-2015

Mildura 11.0

Victoria 8.9

Rank 21

\*Clients of all disability services, by client's residential address, reported as rate per 1,000 total population.

#### A.11 Disability support pensioners, June 2016, Public Health Information Development Unit (LGA) TL

The Mildura LGA has a considerably higher proportion of all persons aged 16 to 64 years receiving a disability support pension than its Victorian counterparts (9.1% versus 4.9%). This proportion has declined since 2014 (from 9.9% to 9.1%), however this decline should not be viewed necessarily as a decline in need.

Disability support pensioners (as a proportion of all persons aged 16 to 64 years), 2016  
Mildura 9.1%  
Victoria 4.9%

Time Trend a declining rate of disability support pensioners between 2014 and 2016, consistent with declines seen at the Victorian level ↓

**A.12 Disability support pension recipients (per 1,000 eligible population), 2015 (September quarter), Department of Social Security (DSS) Payment Demographic Data (LGA)**  
TL / R

This measure reflects the number of people per 1,000 eligible population who are receiving the Disability Support Pension (DSP). The eligible population includes people aged 16 and over who are not yet eligible for the Age Pension (i.e. aged 64 or younger) and who qualify for the Disability Support Pension. The purpose of Disability Support Pension is to provide income support for people who have a permanent physical, intellectual or psychiatric impairment. DSP is designed to give people an adequate means of support if they are unable to work for at least 15 hours per week at or above the relevant minimum wage, independent of a program of support.

The rate figures presented below are in keeping with the earlier proportion figures in indicating that the Mildura LGA is above the State in demand but experiencing a steady decline (in supply). The 2015 rate disability support pension recipients per 1,000 eligible population sees Mildura LGA ranked 12<sup>th</sup> of 79 LGAs.

Disability support pension recipients (per 1,000 eligible population), 2015

Mildura **93.9**

Victoria 51.3

Rank 12

Time Trend – decreasing proportion of the eligible population receiving a disability support pension between 2013 and 2015 ↓

Disability support pension recipients (per 1,000 eligible population), 2013

Mildura **99.4**

Victoria 54.9

Rank 10

Source: Department of Social Security (DSS) Payment Demographic Data, September quarter 2015 DSS.

**A.13 Health** Disability/sickness payment, Distribution of Disability Pensions and Sickness Allowances Rates (Per 1,000 residents), Quarter March to May 2017, Centrelink (2017) (LGA and SA2) *(Table 4.3, 2012 Social Indicators Report)*

Changes to Department of Social Services (DSS) data reporting meant postcode level data was no longer available for this measure (post June 2014). It was agreed to commence reporting this measure at the SA2 level. Tables could not be retro-filled (as has been the case for some Social Indicators Report measures) because the data was unavailable at the required geographical level.

<http://data.gov.au/dataset/dss-payment-demographic-data/resource/b7ee7acf-adba-4434-a1e4-7c7d65b04851>

Drawing on DSS data for the SA2 and LGA levels the following table was compiled. Rates per 1,000 residents (as was the methodology use in the *2012 Social Indicators Report*) were calculated based on 2016 Census of Population and Housing total populations for the Mildura LGA and its SA2s.

Analysis reveals that within the Mildura LGA the SA2s of Mildura (which includes both Mildura North and Mildura South – because DSS still report based on 2011 SA2 classifications) and Red Cliffs have the highest rates (per 1,000 population) of residents receiving a Disability Support Pension or Sickness Allowance (59.1 and 57.7 respectively). These results mirror that reported in the *2012 Social Indicators Report*. The lowest rate by far was in the Irymple SA2 (29.5). The loss of detail incurred by the inability to code data by postcode is most obvious for the Mildura Region which returns a rate of 50.5 per 1,000, masking the significant highs and lows of Disability Support Pension or Sickness Allowance recipients reported in the *2012 Social Indicators Report*.

Distribution of Disability Pensions and Sickness Allowances Rates (Per 1,000 residents), Quarter March to May 2017

SA2 Name (2011)	Disability Support Pension	Sickness Allowance	Total SA2 population	Total Disability Support Pension and Sickness Allowance, No. (rate per 1,000)
Irymple	203	0*	6,874	203 (29.5)
Merbein	246	5*	4,778	251 (52.5)
Mildura (includes both Mildura North and Mildura South)	1,916	11	32,623	1,927 (59.1)
Mildura Region	188	0*	3,720	188 (50.5)
Red Cliffs	339	0*	5,879	339 (57.7)
<b>Mildura LGA</b>	<b>2,892</b>	<b>20</b>	<b>53,878</b>	<b>2,912 (54.0)</b>
Robinvale	147	0*	3,313	147 (44.4)
Wentworth-Buronga	291	0*	5,967	291 (48.8)

\* Please note, to maintain privacy of the data in a machine readable format, values of less than five have been randomly assigned either a zero or a five.

Rates Methodology: (Numerator – Total number of Disability Support Pensions and Sickness Allowances received in a SA2 / Denominator – Total SA2 population\*\*) x 1,000

**A.16 Unpaid Assistance to a Person with a Disability, People aged 15 years and over, 2016, ABS Census of Population and Housing (2017) (LGA and SA2)**

Across the Mildura LGA there are a greater proportion of residents aged 15 years and over providing unpaid assistance to a person with a disability than is the case for their Victorian counterparts (12.2% versus 11.6%). Further each SA2 has a greater proportion of residents aged 15 years and over providing unpaid assistance to a person with a disability than is the case for their Victorian counterparts. The SA2 with the highest proportion of residents providing assistance is Merbein and Surrounds (13.5%). The proportion of the Mildura LGA population aged 15 years and over providing unpaid assistance to a person with a disability remained unchanged from the 2011 Census where it also recorded 12.2% (Victoria had increased from 11.3% in 2011 to 11.6% in 2016).

Provided unpaid assistance to a person with a disability (last two weeks), People aged 15 years and over, 2016

	Number (providing unpaid assistance)	%
Mildura – North SA2	1,717	11.7
Mildura – South SA2	1,408	11.9
Merbein & Surrounds SA2	523	13.5
Irymple & Nichols Point SA2	696	12.8
Red Cliffs & Surrounds SA2	618	13.0
Mildura Region SA2	371	12.0
Mildura LGA	5,332	12.2*
Victoria	560,866	11.6

Wentworth – Buronga SA2	585	12.1
-------------------------	-----	------

Proportions methodology: Numerator – number of persons (aged 15 years and over) in each SA2 providing unpaid assistance / Denominator – total number of SA2 persons aged 15 years and over

\*The Mildura LGA is colour coded against Victoria. Each SA2 is colour coded according to how it is placed either above or below the Mildura LGA proportion.

This table is based on place of usual residence.

NOTE: there are small random adjustments made to all cell values to protect the confidentiality of data. These adjustments may cause the sum of rows or columns to differ by small amounts from table totals.

## Domain 3: Victorians have the capabilities to participate

### Outcome 3.2: Victorians participate in and contribute to the economy

#### INDICATOR – Increase labour market participation

#### 3.46 Selected Labour Force, Education and Migration Characteristics, 2016, ABS Census of Population and Housing 2017 (LGA and SA2) TL

The following table, drawn from the 2016 Census of Population and Housing's SA2 level General Community Profiles reports a selection of measures including:

- Unemployment: Unemployment was higher in the Mildura LGA than at the Victorian level (7.3% compared to 6.6%), and within the Mildura LGA was highest in the Mildura North SA2 (9.8%) and lowest in the Irymple SA2 (4.4%) and Mildura Regional SA2 (4.7%)
- Labour force participation: Labour force participation was lower in the Mildura LGA than at the Victorian level (55.6% compared to 60.5%), and within the Mildura LGA was lowest in the Mildura North SA2 (54.6%) and highest in the Irymple SA2 (62.7%) and Mildura Regional SA2 (59.4%)
- Employment to population: Employment to population was lower in the Mildura LGA than at the Victorian level (51.6% compared to 56.5%), and within the Mildura LGA was lowest in the Mildura North SA2 (47.4%) and again the highest in the Irymple SA2 (60.0%) and Mildura Regional SA2 (56.5%)
- Non-school qualifications: Non-school qualifications were higher in the Mildura LGA than at the Victorian level (20.8% compared to 16.9%), and within the Mildura LGA were highest in the Irymple SA2 (24.1%) and Merbein SA2 (23.2%) and lowest in the Mildura Regional SA2 (19.4%)
- One year population stability: the proportion of the population living at the same address one year ago was lower in the Mildura LGA than was the case across Victoria (75.8% compared to 77.3%). The lowest level of '1 year' population stability was in the Mildura North SA2 with only 71.5% of the population living at the same address they did one year ago, the highest level of '1 year' population stability was in the Irymple SA2 with 82.1% of the population living at the same address they did one year ago
- Five year population stability: the proportion of the population living at the same address five years ago was the same in both the Mildura LGA and Victoria (54.1%). The lowest level of '5 year' population stability was in the Mildura North SA2 with only 48.0% of the population living at the same address they did five years ago, the highest level of '5 year' population stability was in the Mildura Regional SA2 with 64.7% of the population living at the same address they did five years ago, closely followed by Irymple SA2 with 64.3%.

#### Selected Labour Force, Education and Migration Characteristics, 2016

#### Proportions Methodologies:

1 Numerator - Area 'unemployed looking for work' / Denominator – Area 'total labour force'

2 Numerator - Area 'total labour force' / Denominator – Area 'persons aged 15 years and over'

3 Numerator - Area 'Employed, worked full-time' + 'Employed, worked part-time' + 'Employed, away from work' / Denominator – Area 'persons aged 15 years and over'

4 Numerator - Area 'total non-school qualifications' / Denominator – Area 'persons aged 15 years and over'

5 Numerator - Area 'Lived at same address 1 year ago' / Denominator – Area 'Total Population excluding persons less than 1 year of age'

6 Numerator - Area 'Lived at different address 1 year ago' / Denominator – Area 'Total Population excluding persons less than 1 year of age'

7 Numerator - Area 'Lived at same address 5 years ago' / Denominator – Area 'Total Population excluding persons less than 5 years of age'

8 Numerator - Area 'Lived at different address 5 years ago' / Denominator – Area 'Total Population excluding persons less than 5 years of age'

#### This table is based on place of usual residence.

(a) Applicable to persons aged 15 years and over.

(b) 'Employed, worked full-time' is defined as having worked 35 hours or more in all jobs during the week prior to Census Night.

(c) Includes employed persons who did not state their hours worked.

(d) The number of unemployed persons expressed as a percentage of the total labour force. The ABS Labour Force Survey provides the official estimates of Australia's unemployment rate.

(e) The number of persons in the labour force expressed as a percentage of persons aged 15 years and over.

(f) The number of employed persons expressed as a percentage of persons aged 15 years and over.

(g) Includes 'Certificate III & IV Level, nfd'.

(h) Includes 'Certificate I & II Level, nfd'.

(i) Excludes persons less than 1 year of age. Lived at different address 1 year ago includes persons living elsewhere in Australia or overseas 1 year ago.

(j) Excludes persons less than 5 years of age. Lived at different address 5 years ago includes persons living elsewhere in Australia or overseas 5 years ago.

Please note that there are small random adjustments made to all cell values to protect the confidentiality of data. These adjustments may cause the sum of rows or columns to differ by small amounts from table totals.

### 3.47 3.2.1.1.A Unemployment rate, 2016, Census of Population and Housing ABS 2016 (LGA)

At an individual level, unemployment impacts a person's ability to afford basic necessities such as food and shelter and is linked to levels of personal satisfaction, depression, anxiety, suicide and CVD with a reduction in life expectancy. Insufficient employment opportunities may lead to a decline in health and skill levels of unemployed people, family breakdown and increased crime rates. For the community, unemployed adults lose skills causing a decline in human capital which can impact economic growth. Long-term unemployment substantially reduces future employment prospects and potentially changes entrenched cyclical unemployment into structural unemployment. It can result in deep distress, worse mental and physical health, higher mortality rates, hamper children's educational progress, and lower their future earnings (DHHS, 2017a).

#### Unemployed (of people who reported being in the labour force, aged 15 years and over), 2016

Mildura 7.3%

Victoria 6.6%

Time Trend – between the 2011 to 2016 Census reporting periods unemployment increased at both the Mildura LGA level and Victorian level ↑  
For both reporting periods Mildura LGA remained above the Victorian unemployment rates.

#### Unemployed (of people who reported being in the labour force, aged 15 years and over), 2011

Mildura 6.6%

Victoria 5.4%

Source: ABS Census of Population and Housing QuickStats, 2011 & 2016

### 3.48 **Economic** Unemployment, Comparative Rates of Unemployment, 2016, Census of Population and Housing ABS 2017 (LGA and SA1) TL *(Section 7.5 2012 Social Indicators Report)*

The Mildura LGA unemployment rate grew from 6.6% in 2011 to 7.3% in 2016, an increase of 0.7 percentage points. This is comparative to Regional Victoria where unemployment rates grew by 0.8 percentage points from 5.2% in 2011 to 6.0% in 2016 and Melbourne where unemployment rates grew by 1.3 percentage points from 5.5% in 2011 to 6.8% in 2016.

Across the Mildura LGA, at the 2016 Census period, unemployment rates were highest in Mildura North (9.8%) and Millewa (8.1%) both of which have increased since the 2011 Census period (Millewa significantly so), while the lowest unemployment rate was recorded in Nichols Point (1.2%) and the Mallee Track (2.5%).

#### Comparative Rates of Unemployment, 2016

SA1 Grouping*	Unemployed (%)
Merbein	7.1
Mildura North	9.8
Mildura South	7.0
Nichols Point	1.2
Irymple	4.6
Koorlong / Cardross (Greater)	6.4
Red Cliffs	7.0
Millewa	8.1
Nangiloc / Colignan (Greater)	6.7
Ouyen / Walpeup	2.9
Mallee Track	2.5
<b>Mildura LGA</b>	<b>7.3</b>
Robinvale	6.3
NSW towns	6.0
Regional Victoria **	6.0
Melbourne ***	6.8
Victoria	6.6

 Proportions Methodology (% of unemployed, based on Quickstats methodology): Numerator - Number of residents identifying as unemployed in Area (where Unemployed is sum of 'Unemployed, looking for full-time work' and 'Unemployed, looking for part-time work') / Denominator – Total Labour Force in Area (where Labour Force is sum of 'Employed, worked full-time', 'Employed, worked part-time', 'Employed, away from work', 'Unemployed, looking for full-time work' and 'Unemployed, looking for part-time work'). Excludes 'Not in the Labour Force', 'Not Stated' and 'Not Applicable'

\* refer to Appendix 2 for SA1 Grouping methodology, NOTE SA1 Groupings may or may not reflect SA2 areas.

\*\* Regional Victoria refers to the 2016 Census classification of 'Rest of Victoria' – which is the remaining area within the State of Victoria which does not fall within the Melbourne Greater Capital City Statistical Area geography

\*\*\* Melbourne refers to the Greater Capital City Statistical Area of Melbourne (GCCSA)

### 3.49 People receiving an unemployment benefit long-term (longer than 6 months), 2016, Public Health Information Development Unit (LGA)

Between 2014 and 2016 the proportion of Mildura LGA residents aged 16 to 64 years receiving an unemployment benefit for longer than 6 months increased from 7.3% to 8.0% (almost twice the proportion identified at the Victorian level in 2016 at 4.1%).

People receiving an unemployment benefit for longer than 6 months (as a percentage of people aged 16 to 64 years), 2016

Mildura 8.0%

Victoria 4.1%

Time Trend an increasing proportion of Mildura LGA residents receiving an unemployment benefit for longer than 6 months between 2014 and 2016 ↑

People receiving an unemployment benefit for longer than 6 months (as a percentage of people aged 16 to 64 years), 2014

Mildura 7.3%

Victoria 4.2%

Methodology: numerator - People receiving an unemployment benefit for longer than 6 months / denominator - Persons aged 16 to 64 years

Source: Social Health Atlas of Australia, Victoria, Data by Local Government Area. Published June 2017

### 3.50 3.2.1.2 Proportion of young people 17–24 years who are engaged in full-time education and/or work, 2016, ABS Census of Population and Housing 2017 (LGA)

Young people who are not engaged in education, employment or training are at greater risk of poor health, depression or early parenthood. A school leaver's range of options can include work, university or vocational training and many combinations of work and education. This measure is included to quantify young people's engagement in education, training and work (DHHS, 2017a).

Analysis of 2016 Census of Population and Housing data collated for Engagement in Employment, Education and Training by ages 17-24 years reveals significantly lower rates of young people aged 17-24 years are 'fully engaged' in the Mildura LGA (57.1%) compared to their Victorian peers (71.8%). Higher proportions of young people aged 17-24 years in the Mildura LGA are 'not engaged' (16.2%) compared to their Victorian counterparts (10.0%).

#### Engagement in Employment, Education and Training\* by Age (17-24 years), 2016

Engagement in Employment, Education and Training	Mildura LGA (No.) %	Victoria (No.) %
Fully engaged	(3,008) 57.1%	(454,643) 71.8%
Partially engaged	(804) 15.3%	(69,636) 11.0%
At least partially engaged	(146) 2.8%	(10,827) 1.7%
Not Engaged	(853) 16.2%	(61,424) 10.0%
Engagement status undetermined/Not Stated	(455) 8.6%	(36,959) 5.8%
TOTAL	5,266	633,489

Source: ABS TableBuilder, <http://www.abs.gov.au/websitedbs/censushome.nsf/home/tablebuilder>

\*Engagement in Employment, Education and Training was a new item to the ABS Census of Population and Housing in 2016 as such time trend data cannot be provided. Engagement in Employment, Education and Training classifies a person's participation in work and/or study. It is derived from Labour Force Status (LFSP), Hours Worked (HRSP), Full-Time/Part-time Student Status (STUP) and Age (AGEP). It excludes persons aged under 15 years.

### 3.51 Destinations of School Leavers rates (based on 2011 Census data), Community Indicators Victoria (LGA)

The activities of young people who have left school have been sourced from 2011 Australian Bureau of Statistics. These data describe the level of engagement in work and study activities of 15-19 year-olds who are not attending school. This population can be categorised into three major groups: fully engaged school leavers are defined as those who are involved in work and/or non-school study on a full-time basis; disengaged school leavers are defined as those who are not involved in any work or study activities at all; and the remaining school leavers are defined as partly engaged.

Within the Mildura LGA the percentage of fully engaged school leavers in 2011 was 54.2%, well below their Victorian peers at 72.0%. The percentage of fully disengaged school leavers was 25.1%, well above their Victorian peers at 15.0%.

#### Fully Engaged School Leavers (aged 15-19 years), 2011

Mildura 54.2%

Victoria 72.0%

#### Fully Disengaged School Leavers (aged 15-19 years), 2011

Mildura 25.1%

Victoria 15.0%

### 3.52 School Leaver Demographics and Destinations (Early Leavers and Year 12 or Equivalent Completers), 2015, On Track survey data (2016) (LGA) TL

On Track is a large-scale survey designed to monitor the destination outcomes of Year 12 or equivalent completers and early school leavers six months after leaving school. Students who consent to participate in the survey are contacted six months after leaving school. Participation in the survey is voluntary and school leavers may opt-out of completing the survey when contacted.

On Track data from the 2015 school leavers (collected and reported in 2016) provides a 'snapshot' of the movements of 2015 school leavers. Some of the data collected through the On Track Survey is presented in the tables below.

Year 12 or equivalent completers are defined as those who completed a Victorian Certificate of Education (VCE), International Baccalaureate (IB) or Victorian Certificate of Applied Learning (VCAL, Senior or Intermediate). The sample includes those who completed such qualifications in schools, or in TAFE institutions, or Adult and Community Education providers.

#### 2016 On Track survey participation, Year 12 or equivalent completers in Mildura LGA who exited school, 2015

	Males	Females	Total
On Track participation	Number	Number	Number
School leavers in cohort	247	288	535
Consented to participate	187	228	415
Responded to survey	121	149	270
Participation rate (per cent)	49.0	51.7	50.5

**Note:** Participation rate = On Track respondents as a proportion of school leavers in cohort

Source: On Track Survey Results, Destinations of Students who Exited School In 2015 Mildura (RC)

<http://www.education.vic.gov.au/about/research/pages/ontrack.aspx> accessed 09/05/2017

For On Track, early school leavers are defined as students who had registered their details with the VCAA by enrolling in an IB program or a VCE or VCAL unit, and who left school without completing one of the following certificates: VCE, IB, VCAL Senior or VCAL Intermediate. In general, early school leavers had been in Year 10, 11 or 12 when they left school. As such, the sample does not represent all early leavers from Victorian schools. Findings based on the early school leavers' data should be treated with caution due to the relatively low response rate.

#### 2016 On Track participation, early school leavers in Mildura LGA who exited school, 2015

	Males	Females	Total
On Track participation	Number	Number	Number
School leavers in cohort	172	144	316
Consented to participate	114	104	218
Responded to survey *	38	34	72
Participation rate (per cent)	22.1	23.6	22.8

**Note:** Participation rate = On Track respondents as a proportion of school leavers in cohort.

\* The early school leaver response rate is affected by a number of factors:

Early school leavers who had not attended school in 2015 or had returned to school in 2016 were out of scope of the survey but were included in the cohort file.

A proportion of early school leavers could not be contacted or had unusable or incorrect contact information.

### 3.55 **Economic** Recipients of Newstart Allowance (Quarter March to May 2017), Centrelink (2017) (SA2a and LGA) *(Table 7.6 2012 Social Indicators Report)*

The *2012 Social Indicators Report* noted that the Federal initiative known as Newstart provides financial assistance in the form of allowances to those eligible who are actively looking for work. The stated purpose of this allowance is to support individuals to undertake activities which may increase their chances of finding a job. The methodology established for reporting on this measure in the *2012 Social Indicators Report* was for the number of Newstart recipients in each community as a proportion of that community's labour force. This methodology has been applied below.

In the *2012 Social Indicators Report* this measure was reported at the postcode level. However changes to Department of Social Services (DSS) data reporting meant postcode level data was no longer available for this measure (post June 2014). It was agreed to commence reporting this measure at the SA2 level. Tables could not be retro-filled (as has been the case for some Social Indicators Report measures) because the data was unavailable at the required geographical level.

<http://data.gov.au/dataset/dss-payment-demographic-data/resource/b7ee7acf-adba-4434-a1e4-7c7d65b04851>

The *2012 Social Indicators Report* found that Mildura central reported the highest proportion of its local labour force receiving Newstart allowance (10.6%), 2.2 percentage points higher than the Mildura LGA (8.8%). Drawing on 2017 Centrelink data for the March to May quarter again reveals Mildura central (this time defined as the Mildura North and Mildura South SA2s) had the highest proportion of its local labour force receiving Newstart allowance (12.3%) compared to the Mildura LGA (10.3%).

Once again Irymple (this time as the Irymple SA2) reported the lowest proportion of its labour force as recipients of Newstart allowance, 5.1% in 2017 compared to 5.2% in the *2012 Social Indicators Report*.

Proportion of Total Labour Force receiving Newstart Allowance, Quarter March to May 2017

SA2 Name (2011)	Newstart Allowance (#)	Total Labour Force* (#)	Proportion of Labour Force receiving Newstart Allowance
Irymple	175	3,421	5.1%
Merbein	218	2,151	10.1%
Mildura (includes both Mildura North and Mildura South)	1,752	14,251	12.3%
Mildura Region	111	1,830	6.1%
Red Cliffs	240	2,627	9.1%
<b>Mildura LGA</b>	<b>2,496</b>	<b>24,286</b>	<b>10.3%</b>
Robinvale	151	1,311	11.5%
Wentworth-Buronga	320	2,540	12.6%

Proportions Methodology: (Numerator – Total number of Newstart Allowances received in a SA2 / Denominator – Total SA2 Labour Force)

### 3.56 **Economic** Occupational categories, Proportion of Employees in Occupational Categories, 2011, ABS Census (SA1) *(Section 7.1 2012 Social Indicators Report)*

As was the case in the *2012 Social Indicators Report* this measure presents occupational patterns across the aggregated regional localities of 'Mildura-Rural' (the SA2s of Mildura Region, Red Cliffs and Merbein) and 'Mildura-Central' (the SA2s of Mildura North, Mildura South and Irymple) and compares them with findings for Victoria, Regional Victoria and Melbourne.

Once again Mildura – Central and Regional Victoria recorded relatively similar proportions of workers in each of the occupational categories in 2016, with only the higher proportion of sales workers in Mildura – Central representing any significant difference. In comparison to averages for Victoria and Melbourne, Mildura – Central reported a lower proportion of professionals and higher proportion of both sales workers and labourers.

Mildura – Rural reported a higher proportion of managers, the majority of which are farmers managing their own properties, and labourers than any of the other areas. A lower proportion of professionals was also a feature of the Mildura – Rural areas. All these trends are consistent with those observed in 2011 (as reported in the *2012 Social Indicators Report*).

#### Proportion of Employees in Occupational Categories, 2016

Occupational Category	Mildura – Rural*	Mildura – Central**	Victoria	Regional Victoria ***	Melbourne ****
Managers	(1,294) 20.9%	(1,990) 12.2%	(369,922) 13.5%	(90,134) 14.6%	(279,604) 13.2%

Proportions methodology

\*Mildura – Rural includes the SA2s of Mildura Region, Red Cliffs and Merbein

\*\*Mildura – Central includes the SA2s of Mildura North, Mildura South and Irymple

\*\*\* Regional Victoria refers to the 2016 Census classification of 'Rest of Victoria' – which is the remaining area within the State of Victoria which does not fall within the Melbourne Greater Capital City Statistical Area geography

\*\*\*\* Melbourne refers to the Greater Capital City Statistical Area of Melbourne (GCCSA)

### 3.57 Industry of Employment by Occupation, 2016, ABS Census of Population and Housing 2017 (LGA) TL

#### Industry of Employment by Occupation, 2016

Review of 2016 Census of Population and Housing data presented in the General Community Profiles reveals:

- The Mildura LGA has higher than the reported Victorian proportions of the following occupations – Managers; Technicians and trades workers; Community and personal service workers; Sales workers; Machinery operators and drivers; Labourers; and Inadequately described/Not stated.
- Conversely the Mildura LGA has lower than the reported Victorian proportions of the following occupations – Professionals; and Clerical and administrative workers.
- In relation to industry of employment the Mildura LGA has higher than the reported Victorian proportions of the following industries – Agriculture, Forestry & Fishing; Mining; Electricity, Gas, Water and Waste Services; Retail Trade; Accommodation and Food Services; and Health Care and Social Assistance
- Conversely the Mildura LGA has lower than the reported Victorian proportions of the following industries – Manufacturing; Construction; Wholesale Trade; Transport, Postal and Warehousing; Information Media and Telecommunications; Financial and Insurance Services; Rental, Hiring and Real Estate Services; Professional, Scientific and Technical Services; Arts and Recreation Services; and Inadequately described/Not stated.

Please note that there are small random adjustments made to all cell values to protect the confidentiality of data. These adjustments may cause the sum of rows or columns to differ by small amounts from table totals.

3.58 **Economic** Occupations, Skilled Workers (proportion of workforce in Occupational Categories of ‘Professionals’ and ‘Technicians and Trades Workers’), 2016, ABS Census of Population and Housing (2017) (LGA and SA1) TL *(Table 7.2 2012 Social Indicators Report)*

In 2016, the number of skilled workers (professionals, technicians and trade workers) as a proportion of all occupations in the Mildura LGA was 29.3% compared to the Victorian proportion of 36.4% (a difference of 7.1 percentage points). Between the 2011 and 2016 Census periods this had declined slightly from 29.4% in 2011 to 29.3% in 2016 for the Mildura LGA whilst at the Victorian level there was a slight increase from 36.2% in 2011 to 36.4% in 2016.

While still slightly below the Victorian proportion (36.4%), the highest proportion of skilled workers within Mildura LGA were recorded in Nichols Point (34.9% up from 32.7% in 2011) followed by Mildura North (31.7% up from 31.4% in 2011). The lowest proportion of skilled workers was recorded in Millewa (8.5%) and Nangiloc / Colignan (10.2%).

\*\* Regional Victoria refers to the 2016 Census classification of 'Rest of Victoria' – which is the remaining area within the State of Victoria which does not fall within the Melbourne Greater Capital City Statistical Area geography

\*\*\* Melbourne refers to the Greater Capital City Statistical Area of Melbourne (GCCSA)

### 3.59 Highly skilled workforce rates (occupations with ANZSCO Skill Levels 1-3\*, from 2011 Census), 2011, Community Indicators Victoria 2017 (LGA) TL

A lesser proportion (52.3%) of employed persons working in Mildura worked in highly skilled occupations compared to the Victorian State average of 57.3% (and the Loddon Mallee Region average of 54.5%).

#### Highly skilled workforce rates, 2011

Mildura 52.3%

Victoria 57.3%

Source: [http://www.communityindicators.net.au/wellbeing\\_reports/mildura](http://www.communityindicators.net.au/wellbeing_reports/mildura) accessed 28/10/2017

Proportions Methodology: *People Employed in Highly Skilled Occupations*: expressed as a percentage of people who are working in the area.

\*A highly skilled occupation has been defined as one with a skill level of 1, 2 or 3 as assigned in the Australian and New Zealand Standard Classification of Occupations (ANZSCO), First Edition. The skill levels are defined as follows:

*Skill Level 1*: Commensurate with a bachelor degree or higher qualification. At least five years of relevant experience may substitute for the formal qualification. In some instances relevant experience and/or on-the-job training may be required in addition to the formal qualification.

*Skill Level 2*: Commensurate with an AQF Associate Degree, Advanced Diploma or Diploma. At least three years of relevant experience may substitute for the formal qualification. In some instances relevant experience and/or on-the-job training may be required in addition to the formal qualification.

*Skill Level 3*: Commensurate with an AQF Certificate IV, or AQF Certificate III including at least two years of on-the-job training. At least three years of relevant experience may substitute for the formal qualifications listed above. In some instances relevant experience and/or on-the-job training may be required in addition to the formal qualification.

In the 2006 Census, information sufficient to determine occupation was not obtained from 1.1% of employed Victorians ('inadequately described' and 'not stated' categories). These people were excluded from the population prior to the calculation of proportions. Rates of non-response across LGAs ranged from 0.5% to 1.5%. In

addition, some employed people did not provide their workplace address, and some people did not provide a response enabling the determination of labour force status, and both of these groups have been excluded.

3.60 **Economic** Types of business, Proportion of Businesses by Industry by SA2, June 2016, ABS Census of Population and Housing (SA2) *(Section 7.3 2012 Social Indicators Report)*

Similar as reported in the *2012 Social Indicators Report* in 2016, Mildura Region (66.4%), Red Cliffs (53.1%) and Merbein (47.6%) had a strong dominance of agricultural based businesses (compared to Mildura North with the lowest proportion at 10.8%). In contrast, Irymple and Mildura North and South recorded relatively diversified business activity base – although for each the same three Industry areas dominated.

The key sectors driving the Mildura North economy were Construction (13.1%), Rental, Hiring, & Real Estate Services (12.9%) and Agriculture, Forestry and Fishing (10.8%). The key sectors driving the Mildura South economy were Construction (17.9%), Agriculture, Forestry and Fishing (15.4%) and Rental, Hiring, & Real Estate Services (10.6%). The key sectors driving the Irymple economy were Agriculture, Forestry and Fishing (35.8%), Construction (17.5%), Rental, Hiring, & Real Estate Services (9.9%).

Proportions methodology: Numerator – Number of Businesses in an Industry, by Area / Denominator – Total Businesses in an Area

3.61 **Economic** Employment within business categories, Employment by Industry by Place of Residence, 2016, ABS Census of Population and Housing (2017) (SA1) *(Section 7.4 2012 Social Indicators Report)*

In 2016, the key employment sectors driving Mildura LGA's economy were 'Health Care and Social Assistance' (13.2%), 'Retail Trade' (12.3%), 'Agriculture, Forestry and Fishing' (10.8%) and 'Education & Training' (8.6%). A change from 2011 where the key employment sectors were Agriculture, Forestry and Fishing (15.7%), Construction (11.5%), Manufacturing (11.4%) and Retail Trade (10.7%). These 2016 economic drivers are similar at the Regional Victoria level 'Health Care and Social Assistance' (14.3%), 'Retail Trade' (10.6%), 'Construction' (8.8%), 'Education & Training' (8.7%), 'Manufacturing' (8.1%), and 'Agriculture, Forestry and Fishing' (7.7%).

Agriculture is the main employing sector across much of the Mildura LGA and particularly in the SA1 Groupings of Nangiloc / Colignan (59.8%), Millewa (59.5%), Mallee Track (54.7%), Ouyen / Walpeup (28.3%) and Red Cliffs (14.0%). This was also the case in 2011.

The overall proportional pattern for employment within Mildura LGA has remained generally stable since 2011. The most significant change over the five years to 2016 has been declines in the proportional shares to Manufacturing (down 5.3 percentage points from 11.4 in 2011 to 6.1 in 2016), Agriculture (down 4.9 percentage points from 15.7 in 2011 to 10.8 in 2016) and Construction (down 4.7 percentage points from 11.5 in 2011 to 6.8 in 2016). Gains in the proportional shares have accrued to Health Care & Social Assistance (up 9 percentage points from 4.2 in 2011 to 13.2 in 2016) and Education and Training (up 4 percentage points from 4.6 in 2011 to 8.6 in 2016).

### 3.62 Economic Taxable income, Taxable Income Distribution, 2013/2014 and 2014/2015 Australian Taxation Office (postcode) *(Section 7.6 2012 Social Indicators Report)*

The average taxable income of Mildura LGA residents reached \$42,050 in 2014/15, representing an increase of 8% since 2013/14. The taxable incomes across the communities generally recorded an upward trend between 2013/14 and 2014/15 especially the postcodes of Walpeup (44%) and Colignan / Nangiloc (11%). In contrast the communities of Mildura, Nichols Point and Underbool only experienced a growth of 2% between 2013/14 and 2014/15. For the Mildura LGA, at each reported period, the average taxable income was less than it was for their 'Greater Melbourne' and 'Rest of Victoria' counterparts. However the average growth between 2013/14 to 2014/15 was greater (at 8%) than was the case for 'Greater Melbourne' (2%) and 'Rest of Victoria' (1%).

## Domain 3: Victorians have the capabilities to participate

### Outcome 3.3: Victorians have financial security

#### INDICATOR – Decrease financial stress

The health and wellbeing of individuals and populations are influenced by, and determined as the result of, the interactions among human biology, lifestyle and environmental (including social) factors, modified by health and other interventions. Socioeconomic characteristics are key determinants of health and wellbeing, and contribute to differences in health or 'health inequality' across the population.

Despite significant achievements in public health in Victoria over the past century, the evidence on socioeconomic status (SES) and health in Australia is unequivocal: people lower in the socioeconomic hierarchy fare significantly worse in terms of their health. Specifically, those classified as having low SES have higher mortality rates for most major causes of death. Their morbidity profile indicates they experience more ill health (both physiological and psychosocial), and their use of healthcare services suggests they are less likely, or may have less opportunity, to act to prevent disease or detect it at an early stage. Although it is clear that poor living and working conditions impair health and shorten lives, the pathways through which these factors act and are related are complex and not yet fully understood (DHHS, 2014).

Socioeconomic status is typically measured by attributes that include educational attainment, occupational status and income. Greater levels of educational attainment are associated with higher levels of knowledge and other non-material resources likely to promote a healthy lifestyle. Education also provides formal qualifications that affect occupational status and associated income level. Occupational status reflects social status, power and material conditions related to paid work. Income provides individuals and families with necessary material resources (including housing and access to transport) and determines their purchasing power for accessing goods and services needed to maintain good health.

In addition to health information, the Victorian Population Health Survey collects information about SES, for example: the 2010 VPHS survey revealed that 10.5% of households had a gross income less than \$20,000 per annum (DHHS, 2014, p175).

#### 3.66 3.3.1.1.A Proportion of adults who ran out of food and could not afford to buy more, Victorian Population Health Survey DHHS (LGA)

This measure was not reported in the 2014 Victorian Population Health Survey reports. It has been retained in this report because of the likelihood it will be reported in subsequent VPHS report.

### 3.67 **3.3.1.1.B** Proportion of children 0–12 years living in households that ran out of food and could not afford to buy more, 2013, VCHWS DET (Mallee Region)

This measure seeks to identify people who may be at risk of a poor diet due to their financial incapacity to purchase food, and/or due to social exclusion. Food and nutrition have long been recognised as important contributors to health. However, food and nutrition affect more than just the physical aspects of our health and wellbeing. The buying, preparing and eating of food is part of everyday life. For many people, food is a focus for social interactions with family, friends and communities (DHHS, 2017a).

This measure, drawn from the Victorian Child Health and Wellbeing Survey administered by the Department of Education and Training, reveals the Mallee Region has almost twice the number of households with children aged 0-12 years who 'ran out of food and could not afford to buy more' (8.0% versus 4.9%).

### 3.68 Percentage of population with food insecurity, 2011, Victorian Population Health Survey DHHS (LGA) TL/R

The food we eat plays a major role in our health and wellbeing. For infants and young children, good nutrition is important for optimal growth and development. For all Australians, good nutrition contributes to quality of life, helps maintain healthy body weight, protects against infections, and reduces the risk of chronic disease and premature death. On the other hand, poor dietary choices are associated with ill health. Chronic diseases that can be related to diet, such as cardiovascular disease, diabetes and some cancers, are a major cause of death and disability in Australia, and their prevalence is steadily increasing. The burden of disease due to poor diet is often associated with large intakes of energy-dense foods, with high saturated fat, sugar and/or salt content, and low intakes of nutrient-dense foods, such as vegetables, fruit and wholegrain cereals. Excessive energy intakes, combined with low levels of physical activity, have contributed to the continuing rise in people identified as overweight and obese. Low-income, particularly single parent and unemployed families, are most at risk of food insecurity. Research shows these families are more likely to select foods that are perceived to be cheaper but that are of poorer quality, with high fat, salt and sugar content (AIHW, 2012).

Food insecurity, as measured by the proportion of persons who ran out of food in the previous 12 months and could not afford to buy anymore, is higher across the Mildura LGA than at the Victorian level according to 2011 data from the Victorian Population Health Survey (5.1% versus 4.6%) but indicating a reduction in food insecurity from the 2008 survey (9.3%).

**3.69 Safe and Secure** Families are financially secure, Single parent families with children aged less than 15 years, 2016, Public Health Information Development Unit (LGA) TL

Economic security can be a contributing factor to positive outcomes for children. There are many elements that contribute to the economic security of a family, including median family income, parental employment status, housing stability, the ability to raise money in an emergency and access to government support (DEECD, 2013). Of these parental education and employment are key measures of socioeconomic status. Generally families without an unemployed parent have low income and are often more socially isolated. One parent families are more likely than couple families to be unemployed or not in the labour force. Parental education is linked not only to employment and income but is also a key predictor of child education and health outcomes (DEECD, 2013).

Families solely or largely dependent on government support for their income have the lowest incomes and fewest resources. Children from these families are likely to be deprived of items considered essential by Australian standards, including access to medical and dental treatment, a substantial meal once a day, school activities and outings, secure housing and warm clothes and bedding. The lack of these resources means children from very low income households are more likely to face lower achievement in education, have worse economic prospects and have poorer health outcomes (AIHW, 2012 and 2013). Increasingly children in welfare dependant families are more likely to get caught in a cycle of intergenerational disadvantage and welfare dependency.

In 2016, of all families across the Mildura LGA with children aged less than 15 years 27.0% were single parent families compared to only 18.3% at the Victorian level.

### 3.71 **Safe and Secure** Families are financially secure, Health Care Card Holders, 2016, Public Health Information Development Unit (LGA) TL

Research broadly acknowledges the increased health and wellbeing risks faced by children living in more disadvantaged areas. Possession of a Health Care Card has become a useful 'proxy' when considering disadvantage. Research by the Melbourne School of Population and Global Health, in partnership with DEECD, found that when considering a range of measures of disadvantage (including low SES families, single parent families, LBOTE, Aboriginality, rurality, low parental education, being born outside Australia and having a mother born outside Australia), children listed on a pension/Health Care Card had the poorest outcomes. Possession of a Health Care Card was strongly and most consistently associated with a higher risk of behavioural and emotional difficulties by 3.5 times and developmental concern by 2.8 times.

Within the Mildura LGA a higher proportion of residents aged 0-64 years held Health Care Cards than their Victorian counterparts (11.5% versus 8.3%).

#### Health Care Card Holders (as a percentage of all people aged 0-64 years), 2016

Mildura 11.5%

### 3.73 Children in low income, welfare-dependent families 2016, Public Health Information Development Unit (2017) (LGA) TL

Poverty has negative consequences for those who are experiencing it: for their sense of self-worth and physical wellbeing, and perhaps most importantly for their children and for future generations. Poverty also damages our social relationships, and our sense of community. Evidence demonstrates that childhood poverty leads to premature mortality and poor health outcomes for adults. There are multiple measures of poverty. The proportion of people living in households below the 50 per cent poverty line, also used by OECD, equates to a very austere living standard – a disposable income of less than \$400 per week for a single adult in 2011–12, with different poverty lines to take account of the number of adults and children in a household (DHHS, 2017a).

Over both the 2014 and 2016 reporting periods the Mildura LGA has a higher proportion of children in low income, welfare-dependant families (as a percentage of children under 16 years) than was witnessed at the Victorian level (14.8% versus 9.5% in 2016 and 35.0% versus 22.6% in 2014).

Children in low income, welfare-dependant families (as a percentage of children under 16 years), 2016

Mildura 14.8%

Victoria 9.5%

Time Trend – there were sharp declines in the proportion of children in low income, welfare dependent families between 2014 and 2016 at both the Mildura LGA and Victoria level ↓

The methodologies for both reporting years were reviewed to determine if these large changes could be attributed to factors outside of the actual proportion of children in low income, welfare dependent families (see discussions below).

Children in low income, welfare-dependant families (as a percentage of children under 16 years), 2014

Mildura 35.0%

Victoria 22.6%

Methodology: numerator - Low income, welfare-dependent families (with children) / denominator – Total families

Source: Social Health Atlas of Australia, Victoria, Data by Local Government Area. Public Health Information Development Unit Published June 2017

<http://phidu.torrens.edu.au/social-health-atlases/data#social-health-atlases-of-australia-local-government-areas> Accessed 20/07/2017

The methodology for this measure has remained consistent between the 2014 and 2016 reporting periods except for a change in income levels. For example; in 2014, the *indicator detail* notes a) families included are those with children under 16 years; or b) children under 16 years in families – **with incomes under \$36,276 p.a.** in receipt of the Family Tax Benefit (A) (whether receiving income support payments or not). These families would all receive the Family Tax Benefit (A) at the maximum level.

By comparison in 2016 the *indicator detail* notes a) families included are those with children under 16 years; or b) children under 16 years in families – **with incomes under \$37,378 p.a.** in receipt of the Family Tax Benefit (A) (whether receiving income support payments or not). These families would all receive the Family Tax Benefit (A) at the maximum level. The level of income used for both time periods is based on the most recent quarterly *Poverty Lines: Australia Newsletter*.

### 3.74 Median house price, 2014, Department of Health and Human Services (LGA) TL / R

The median house price is the value of the middle item when all sale prices are arranged in order of magnitude. The information regarding property values is obtained from Notices of Acquisition, which are required to be completed by each purchaser within one month of the acquisition of any real estate in Victoria. Drawing on this data the Mildura LGA had a median house price of \$225,000 in 2014, above the Victorian median of \$393,000 and seeing them ranked 62<sup>nd</sup> of the 79 Victorian LGAs.

#### Median house price, 2014

Mildura \$225,000

Victoria \$393,000

Rank 62

Time Trend – median house prices increasing across the Mildura LGA between 2012 and 2014 ↑

#### Median house price, 2012

Mildura \$210,000

Victoria \$412,000

Rank 63

3.75 **3.3.1.2** Proportion of households with housing costs that represent 30 per cent or more of household gross income, 2016, ABS Census of Population and Housing (2017) (LGA) TL

Housing or shelter is one of our most basic needs. While there is a complex relationship between housing and health, poor housing is frequently associated with poorer health. Adequate housing means safe, secure and affordable shelter. The adequacy or otherwise of housing is an important component of individual wellbeing. Housing affordability is a relative term linking the cost, availability, demand, and supply of housing together. Affordability of housing will affect choice of location, access to employment, education, essential services and proximity to social and family networks. The cost of housing is particularly significant to people on lower incomes. When costs are high, people have less income to spend on other essential household items. Multiple measures of housing affordability are used, with no accepted national definition (DHHS, 2017a).

Drawing on the 2016 ABS Census of Population and Housing the following 2 measures are reported for the Mildura LGA:

- Households with rent payments greater than 30% of household income,
- Households with mortgage repayments greater than 30% of household income,

During both the 2011 and 2016 Census reporting periods a greater proportion of households in the Mildura LGA spent more than 30% of household income on rent payments than their Victorian counterparts (10.6% versus 10.4% in 2016 and 9.7% versus 9.1% in 2011). Further the proportion increased between 2011 and 2016.

Households with rent payments greater than 30% of household income, 2016

Mildura 10.6%

Victoria 10.4%

Time Trend – an increasing proportion of households in the Mildura LGA experienced rent payments greater than 30% of household income between the 2011 and 2016 Census reporting periods ↑

During both the 2011 and 2016 Census reporting periods a lesser proportion of households in the Mildura LGA spent more than 30% of household income on mortgage repayments than their Victorian counterparts (4.8% versus 7.5% in 2016 and 7.1% versus 10.1% in 2011). The proportion of Mildura LGA households spending more than 30% of household income on mortgage repayments decreased between 2011 and 2016 (from 7.1% in 2011 down to only 4.8% in 2016).

Households with mortgage repayments greater than 30% of household income, 2016

[http://www.censusdata.abs.gov.au/census\\_services/getproduct/census/2016/quickstat/LGA24780?opendocument](http://www.censusdata.abs.gov.au/census_services/getproduct/census/2016/quickstat/LGA24780?opendocument)

3.76 **Social distress** Rental stress, 2011 and 2016, ABS Census of Population and Housing 2017 (LGA and SA2) *(Table 3.2, 2012 Social Indicators Report)*

3.77 **Social distress** Home purchase stress, 2011 and 2016, ABS Census of Population and Housing 2017 (LGA and SA2) *(Table 3.3, 2012 Social Indicators Report)*

The *2012 Social Indicators Report* measures of 'Home Purchase Stress' and 'Rental Stress' were revised in two ways. Firstly, to be reported at the SA2 level (as opposed to the previous SA1 Grouping, refer to Appendix 2 to understand the correlation between SA1 groupings and SA2s) and secondly, to mirror the ABS established measures of 'Households where mortgage payments are 30%, or greater, of household income' and 'Households where rent payments are 30%, or greater, of household income' respectively (rather than the low, medium and high income bands methodology utilised in the *2012 Social Indicators Report*). Revising the reporting of these measures enabled the provision of a simple, recognised and long-term methodology for measuring and reporting Rental and Home Purchase Stress.

Due to the change in methodology of these measures 2011 Census data has been provided for 'Households where mortgage payments are 30%, or greater, of household income' (previously Home Purchase Stress) and for 'Households where rent payments are 30%, or greater, of household income' (previously Rental Stress) to facilitate greater continuity of reporting. Data from the 2006 Census was not available because both the SA2 geography had not been applied to the Mildura LGA in 2006 nor was the '30% or greater' measure being reported.

Review of the 2006 Census data does indicate that, for the Mildura LGA, the medium weekly rent was \$150 and the Median monthly mortgage repayment was \$1,000 whilst the median weekly incomes were \$395 (personal), \$1,022 (family) and \$785 (household). By 2011, for the Mildura LGA, the medium weekly rent was \$170 and the Median monthly mortgage repayment was \$1,268 whilst the median weekly incomes were \$463 (personal), \$1,092 (family) and \$878 (household). Most notable amongst these figures is the increase of only \$70 in median weekly incomes for families between 2006 and 2011.

In comparing 2011 and 2016 Census of Population and Housing data areas of note include:

- In both 2011 and 2016 Mildura LGA had a greater proportion of 'Households where rent payments are 30%, or greater, of household income' than their Victorian counterparts. In 2011 9.7% of Mildura LGA households paid 30% or more of their household income to rent compared to 9.1% of Victorian households. In 2016 this had increased by 0.9 percentage points for Mildura LGA renters with 10.6% households paying 30% or more of their household income to rent compared to 10.4% of Victorian households.
- In both 2011 and 2016 Mildura LGA had a lesser proportion of 'Households where mortgage repayments are 30%, or greater, of household income' than their Victorian counterparts. In 2011 7.1% of Mildura LGA households paid 30% or more of their household income to mortgages compared to 10.1% of Victorian households. In 2016 the proportion of households experiencing mortgage stress had lessened with only 4.8% of Mildura LGA households paying 30% or more of their household income to mortgages. This reduction in the proportion of households experiencing mortgage stress was also seen at the Victorian level with 7.5% of Victorian households experiencing mortgage stress (down from 10.1% in 2011).
- Within the Mildura LGA the SA2 experiencing the highest level of rental stress in 2011 was the Mildura SA2 (12.5% of households), this trend remained in 2016 with households in the Mildura North SA2 experiencing the highest level of rental stress (16.3%) followed by households in the Mildura South SA2 (10.7%). In 2011 the Mildura Regional SA2 experienced the lowest proportion of homes with rental stress (3.3%), this was again the case in 2016 with only 3.0% of households in the Mildura Regional SA2 experiencing rental stress.
- Within the Mildura LGA the SA2 experiencing the highest level of mortgage stress in 2011 was the Irymple SA2 (8.9% of households), in 2016 households in the Merbein SA2 experienced the highest level of mortgage stress (7.0%) followed by households in the Irymple SA2 (6.5%). In 2011 the Mildura Regional SA2 experienced the lowest proportion of homes with mortgage stress (3.6%), in 2016 the Mildura North SA2 had the lowest proportion of households experiencing mortgage stress (3.7%). Please note in applying the traffic light presentation system the Mildura LGA is rated comparative to Victoria and each SA2 within the Mildura LGA is rated comparative to the Mildura LGA.

\*Proportions in this table are calculated by taking the number of households whose rent payments were 30% or more of an imputed income measure and expressing this number as a proportion of the total number of households in an area, including those households which are not renting their dwelling (excluding the small proportion of visitor only and other non-classifiable households). The nature of the income imputation means that the reported proportion may significantly overstate the true proportion.

\*\*Proportions in this table are calculated by taking the number of households who own their dwelling, and whose mortgage payments were 30% or more of an imputed income measure and expressing this number as a proportion of the total number of households in an area, including those households which were renting their dwelling (excluding the small proportion of visitor only and other non-classifiable households). The nature of the income imputation means that the reported proportion may significantly overstate the true proportion.

3.80 **Safe and Secure** Families are financially secure, Households in dwellings receiving rent assistance from Centrelink, 2016 Public Health Information Development Unit (2017) (LGA) TL

Over both the 2011 and 2016 Census periods there were considerably more households in the Mildura LGA receiving rent assistance from Centrelink than were their Victorian counterparts, for example in 2016 23.2% of Mildura LGA households received rent assistance from Centrelink compared to 15.7% of Victorian households. Similarly in 2011 22.7% of Mildura LGA households received rent assistance from Centrelink compared to 14.5% of Victorian households.

3.81 Proportion of rental housing that is affordable, 2015, Department of Health and Human Services, 2015 (September quarter) (LGA) TL / R

This measure is a reflection of the percentage of rental housing available in an LGA which is affordable for lower income families, where the affordability benchmark is that no more than 30% of income is spent on rent and lower income families are those receiving Centrelink benefit. Whilst at both time periods the proportion of affordable rental housing in the Mildura LGA was greater than the proportion available across Victoria (72.9% versus 19.1%) there was a considerable decline in the proportion of affordable housing in the Mildura LGA between the reporting periods. Over this time period the Mildura LGA moved from being the 11<sup>th</sup> most affordable Victorian LGA to the 23<sup>rd</sup> most affordable LGA.

Proportion of rental housing that is affordable, 2015

### 3.82 Median rent for three-bedroom home, 2015 (September quarter), Department of Health and Human Services (LGA) TL / R

This measure reports the median weekly rent for a three-bedroom house located in the Mildura LGA. Median rents represent the mid-point in the distribution of all rents (i.e. 50% of rents are higher than the median and 50% are lower). Across the two reporting periods (2013 and 2015) median rent for a three-bedroom home was consistently lower than the Victorian level (\$280 versus \$340).

#### Median rent for three-bedroom home, 2015

### 3.84 **Social distress** Family income (low, medium, high, not stated), 2016, ABS Census of Population and Housing 2017 (LGA and SA1) TL *(Table 3.1 Family Incomes, 2012 Social Indicators Report)*

In the 2012 Social Indicators Report the low family income benchmark of below \$650 per week for 2006 (which was used in the 2008 *Mildura Social Indicators Report*) was adjusted for inflation (and rounded), resulting in the revised figure of below \$800 per week for the 2011 data. The higher income benchmark of \$1,400 or more per week was also increased to \$1,500. These same figures are applied to the low, medium and high income categories for the 2016 Census data below.

Mildura LGA continues to record a relatively higher proportion of families within the low income bracket (22.6%, down from 29.6% in 2011) compared to both Regional Victoria (20.8%), Melbourne (15.4%) and Victoria (17.0%). During the five years to 2016 the proportion of high income families in the Mildura LGA increased by 9.3 percentage points from 28.3% in 2011 to 37.6% in 2016, however the medium income family share dropped by 2.1 percentage points (from 29.1% in 2011 to 27.0% in 2016). In both instances these trends mirror that witnessed between 2006 and 2011 as noted in the 2012 Social Indicators Report. These findings are in line with the patterns observed in both Regional Victoria and Melbourne.

Within Mildura LGA, the Merbein recorded the largest proportion of low income families (24.7%), while Nichols Point recorded the lowest proportion of low income families (5.2%). Nichols Point recorded the highest proportion of high income families (52.6%) and Millewa the lowest proportion of high income families (30.4%).

Source: ABS TableBuilder, <http://www.abs.gov.au/websitedbs/censushome.nsf/home/tablebuilder>

Proportions Methodology: Numerator – Area ‘Family Income’ level / Denominator – Total Families in Area

\*Total Family Income (weekly) is not calculated where a family member aged 15 years and over did not state their income, or was temporarily absent. These families are coded to the 'Partial income stated' category. Applicable to: Families in family households

This variable is calculated by summing the personal incomes reported by all family members aged 15 years and over. The Census collects personal income in ranges, so before these can be summed a specific dollar amount needs to be allocated to each person. Median incomes for each range, derived using data from the Survey of Income and Housing, are used for this purpose. <http://www.abs.gov.au/ausstats/abs@.nsf/Lookup/2901.0Chapter3702016>

\*\* refer to Appendix 1 for SA1 Grouping methodology, NOTE SA1 Groupings may or may not reflect SA2 areas.

\*\*\* Incomes Groupings: refers to **Total Family Income** (weekly) of *Low* – \$0-\$799 (including ‘negative income’ and ‘nil income’ categories), *Medium* - \$800-\$1,499, *High* \$1,500 and greater (up to \$8,000 or more). Not Stated includes ‘Partial income stated’ and ‘All incomes not stated’

\*\*\*\* Regional Victoria refers to the 2016 Census classification of ‘Rest of Victoria’ – which is the remaining area within the State of Victoria which does not fall within the Melbourne Greater Capital City Statistical Area geography

\*\*\*\*\* Melbourne refers to the Greater Capital City Statistical Area of Melbourne (GCCSA)

### 3.85 Median Weekly Income, 2016 ABS Census (LGA, SA2) TL

Data below, drawn from the 2016 ABS Census of Population and Housing, reveals the Mildura LGA sits below the Victoria median for each income type (personal, family and household). Please note - incomes for each of the Mildura LGA SA2s are coded red (for below) and green (for above) comparative to the Mildura LGA (not Victoria). Time trend from 2011 is indicated by arrows in the Mildura LGA column (↓↑).

Median weekly incomes <i>People aged 15 years and over</i>	Mildura - North SA2	Mildura - South SA2	Merbein & Surrounds SA2	Irymple & Nichols Point SA2	Red Cliffs SA2	Mildura Region SA2	Mildura LGA	Victoria	Wentworth - Buronga SA2	Robinvale SA2

### 3.87 **Social distress** Lone person households, 2016, ABS Census of Population and Housing (2017) (LGA and SA1) TL *(Table 3.4, 2012 Social Indicators Report)*

While the proportion of lone person households (of all households) in Mildura LGA decreased slightly between 2011 (28.8%) and 2016 (28.6%), this was also the case for Melbourne (23.8% in 2011 compared to 23.2% in 2016). In contrast the proportion of lone person households (of all households) in Regional Victoria increased slightly between 2011 (28.4%) and 2016 (29.0%).

Within the Mildura LGA the SA1 Groupings with the highest proportion of one-person households (of all households) were Ouyen / Walpeup (35.3%) and Nangiloc / Colignan (Greater) (33.7%). The SA1 Groupings with the lowest proportion of one-person households (of all households) were Nichols Point (11.7%) and Koorlong / Cardross (Greater) (16.3%). By comparison the SA1 Grouping with the highest proportion of one-person households (of all households) in 2011 was Mallee Track (29.3%) and the SA1 Grouping with the lowest proportion of one-person households (of all households) was Nichols Point (15.9%).

#### Lone Person Households, 2016

Number of Persons Usually Resident in Dwelling*

## Domain 4: Victorians are connected to culture and community

### Outcome 4.1: Victorians are socially engaged and live in inclusive communities

#### INDICATOR – Increase connection to culture and communities

4.1 **Happy and Healthy** Children, young people & families are supported by positive relationships, Feeling part of the community (Community Connection) (range 0–100), 2011 VicHealth Survey (LGA) TL

Community Connection was measured in the 2011 VicHealth Survey. Respondents were asked to rate their satisfaction with feeling part of their community and answers are presented according to a 0-100 range. Results for the Mildura LGA reveal higher perceptions of community connection than their Victorian peers (77.5 versus 72.3).

Community Connection (0-100), 2011

Mildura 77.5

Victoria 72.3

Time Trend not available, data for Community Connection not collected / presented in the 2015 VicHealth Indicators Survey

[http://www.communityindicators.net.au/wellbeing\\_reports/mildura](http://www.communityindicators.net.au/wellbeing_reports/mildura) Accessed 09/04/2017

4.2 **Level of social isolation among adults (high or very high), 2014, Victorian Population Health Survey, DHHS (LGA) TL**

To be socially isolated is to be deprived of social connectedness. Social isolation is recognised as an important health risk factor for both mental and physical health and is known to increase with declining socioeconomic status. Social isolation has been measured in many different including using single indicators such as living alone, infrequent contact with a social network and being unmarried. Cornwell and Waite (2009) proposed that social isolation consists of two dimensions: lack of social support and loneliness. The 2014 Victorian Population Health Survey has created a composite indicator to measure social isolation using three social support questions and three trust questions from the survey (DHHS, 2017). This composite indicator 'level of social isolation' is reported below.

A higher proportion of adults in the Mildura LGA report 'high or very high' social isolation than their Victorian counterparts (19.1% versus 17.3%). Time trend data is not available for this measure.

Level of social isolation among adults (high or very high), 2014

Mildura 19.1%

Victoria 17.3%

Source: Department of Health and Human Services 2017, Inequalities in the social determinants of health and what it means for the health of Victorians: findings from the 2014 Victorian Population Health Survey, State of Victoria, Melbourne.

<https://www2.health.vic.gov.au/public-health/population-health-systems/health-status-of-victorians/survey-data-and-reports/victorian-population-health-survey/victorian-population-health-survey-2014> Accessed 20/04/2017

#### 4.3 4.1.1.1 Proportion of adults who belonged to a community group, 2014, Victorian Population Health Survey DHHS (LGA)

Community and civic engagement, whether through joining a local club, volunteering or attending a local community event, is supported in the literature as having a direct causal link with better mental and physical health. Further as socioeconomic status declines so too does community and civic engagement. It is hypothesised that volunteering improves health by raising self-esteem, increasing the number of social relationships and improving self-care behaviours. Community and civic engagement is measured through such indicators as membership of organised groups, attendance at local community events, and being involved in the community through volunteering.

Whether individuals take up opportunities for social interaction through community and civic engagement may depend on the extent to which certain conditions are fulfilled including the state of the social environment, the extent and strength of social and support networks, and the relative levels of social and civic trust (DHHS, 2017).

##### Proportion of adults who belong to a community group, 2014

2014	Sports	Religious	School	Professional	Other
Mildura	31.9% ↓	14.2% ↓	16.3% ↑	22.8% ↓	18.6% ↑
Victoria	25.7%	18.6%	13.7%	23.7%	19.4%
2011-2012	Sports	Religious	School	Professional	Other
Mildura	32.4%	18.8%	14.4%	23.0%	17.2%
Victoria	26.5%	18.0%	12.5%	24.0%	18.7%

Time Trend – across the Mildura LGA there were declining levels of membership to sports, religious and professional groups ↓ and increasing membership to school and ‘other’ groups ↑ between the 2011-2012 and 2014 VPHS reporting periods. The largest decline in membership was witnessed in religious group.

Research shows that membership of a sport, school, professional or other community or action group is associated with socioeconomic status. However, membership of a religious group is not. As total annual household income increases the proportion of Victorian adults belonging to a sport, school, professional or other community or action group also increases. In contrast, the proportion of Victorian adults who belong to a religious group does not vary by total annual household income.

Research further shows that adults who belong to a sports or professional group are significantly *less* likely to be psychologically distressed than those who do not, suggesting that membership of a sports or professional group is associated with better mental health. In contrast, there are no significant differences in the proportions of psychological distressed adults whether or not they are a member of a religious, school or other community or action group (DHHS, 2017).

#### 4.4 Proportion of adults who attended a local community event, 2014, Victorian Population Health Survey, DHHS (LGA)

A further indicator of community participation utilised in the Victorian Population Health Survey is attendance at a local community event. Survey respondents were asked, 'Have you attended a local community event in the past six months (like a street festival, sports event at the local oval, school fete, craft exhibition)?' This is an important measure given research shows that adults who attend local community events in Victoria are less likely to be psychologically distressed and to report being in fair or poor health compared with those who do not attend local community events.

Research demonstrates that the higher the total annual household income, the more likely an adult attends a local community event in Victoria. Whilst this finding is counterintuitive to the lower levels of annual household income reported in the Mildura LGA and the high levels of community event attendance reported below, state level research also indicates adults who live in rural Victoria are significantly more likely to attend local community events than those who live in metropolitan Victoria (DHHS, 2017).

##### Proportion of adults who attended a local community event, 2014

Mildura 79.0%

Victoria 58.7%

Time Trend – increasing proportion of adults across the Mildura LGA attending a local community event between the 2011-2012 and 2014 VPHS reporting periods ↑

##### Proportion of adults who attended a local community event, 2011-2012

Mildura 66.0%

Victoria 55.3%

4.9 **Cultural indicators** Art gallery, Proportion of visitors to Art Gallery from Sub-Regions, 2014 – 2016, Mildura Rural City Council (postcode) (*Section 9.1 2012 Social Indicators Report*)

Residents from Mildura continued to account for the vast majority (90%) of visitors to the city’s Art Gallery between 2014 and 2016 followed by Merbein and Irymple (although Merbein experienced a decline in 2016). Certainly the geographical size of the municipality would indicate access may be an issue for some residents.

Proportion of visitors to Art Gallery from Sub-Regions, 2014-2016

Source: Mildura Rural City Council, Mildura Arts Centre, (2017).

\* The presentation of this measure in the *2012 Social Indicators Report* was revised to reflect the manner by which postcode data is collected and grouped by the Mildura Arts Centre. The key change being that Ouyen is not grouped with Mildura, it is instead grouped with ‘Red Cliffs and Surrounds’.

#### 4.10 Cultural indicators Library visits & membership, Mildura Rural City Council (SA2) *(Section 9.2 2012 Social Indicators Report)*

Mildura Rural City Council operates four libraries along with a mobile library service. Building based library services are located in the communities of Mildura City, Merbein, Red Cliffs and Irymple. The Mobile Library Service visits weekly the communities of Nangiloc, Underbool, Walpeup, Cowangie, Murrayville, Ouyen, Werrimull and Cullulleraine.

Mildura's five libraries received over 260,000 actual and virtual visits during the 2015/2016 financial year, a decrease from 355,874 actual and virtual visits recorded in the 2011/2012 financial year. The level of actual (in person) visitation was highest for Mildura's City Library in Deakin Avenue, which received almost 74% (or 145,119) of 196,971 actual library visits for Mildura RCC during 2015/2016. Red Cliffs was the second most highly frequented library with just over 20,000 visits. However both of these libraries recorded a decrease in actual visits between the 2011/2012 and 2015/2016 reporting periods. Likewise there were decreases in actual visits to the Irymple\* and Mildura RCC Mobile\* library during the reported periods of 2011/2012 and 2015/2016. By contrast there was an increase in actual visits to the Merbein library (from 13,659 to 19,511), this increase is attributed to the newly built library facility.

The trend in declining actual visits to the library was also witnessed in virtual visits. During the 2011/2012 – 2015/2016 reporting periods the number of virtual library visits across Mildura RCC decreased from 82,436 to 63,156 (this is after almost doubling in number between 2006/2007 and 2011/2012).

##### Actual and Virtual Library Visits, 2015/16

Visits (2015/2016)	Red Cliffs	Mildura	Merbein	Irymple*	MRCC Mobile Library*	Mildura RCC	Victoria
Actual Number of visits	20,678	145,119	19,511	5,930	5,733	196,971	30,134,212
Virtual Number of visits	-	-	-	-	-	63,156	8,927,167
Total Number of visits	20,678	145,119	19,511	5,930	5,733	260,127	39,061,379

Source: MRCC Library Services (2017)

\* Note comparison of actual library visits between 2011/2012 and 2015/2016 for Irymple library and the MRCC Mobile Library cannot be accurately made as the method for counting library visits changed from electronic counting in 2011/2012 to manual counting in 2015/2016.

Time Trend – both actual and virtual library use across the Mildura LGA decreased between 2011/2012 and 2015/2016 for the Mildura City, Red Cliffs, Irymple and Mobile Library Service ↓

There was an increase in actual visits Merbein library between 2011/2012 and 2015/2016 ↑

#### 4.11 Active library members in municipality, 2015/2016, Department of Environment, Land, Water and Planning (LGA) TL

Active memberships (as a percentage of memberships) is less for the Mildura LGA (37.4%) compared to Victoria (48.5%).

##### Active membership as a percentage of members, 2015/2016

Mildura 37.4%

Victoria 48.5%

Time Trend – across all libraries between the 2011/2012 and 2015/2016 reporting periods there was a decline in active memberships with the exception of Merbein which witnessed a slight increase in active membership. Importantly across the Mildura Rural City Council area the community went from having an active membership above the state average in 2011/2012 (46.4% and 43.5% respectively) to having an active membership considerably below the state average in 2015/2016 (37.4% and 48.5% respectively) ↓

##### Active membership as a percentage of members, 2011/2012

Mildura 46.4%

Victoria 43.5%

Whilst Mildura's city library recorded 80.8% (or 20,649) of all library memberships in Mildura RCC of these memberships only 36.0% were active, where 'active' is defined as members who had borrowed an item over the 12-month reporting period. In the table below 'active membership' at the individual library level is compared to the Mildura LGA proportions. Red Cliffs, Merbein and the Mobile Library all have consistently higher 'active memberships' than the Mildura Library.

Indicator	Red Cliffs	Mildura	Merbein	Irymple	MRCC Mobile Library	Mildura LGA	Victoria
Active Users 2015/16	794	7435	776	179	371	9555	1,026,798
Total Members 2015/16	1,958	20,649	1,589	491	857	25,544	2,118,921
% of Active Membership 2015/16	40.6% ↓	36.0% ↓	48.8% ↑	36.5% ↓	43.3% ↓	37.4% ↓	48.5%
% of Active Membership 2011/12	54.3%	45.2%	47.8%	46.7%	53.4%	46.4%	43.5%

Data from the Department of Environment, Land, Water and Planning presented on the *know your council* website suggests the Mildura LGA has a higher proportion of the 'municipal population that are members of the library and have borrowed a library collection item' than their Victorian counterparts (18.02% versus 17.78%).

##### Percentage of the municipal population that are members of the library and have borrowed a library collection item\*, 2015/2016

Mildura 18.02%

Victoria 17.78%

Time trend – the percentage of municipal population borrowing from MRCC library services declined between 2014/2015 and 2015/2016 ↓

Percentage of the municipal population that are members of the library and have borrowed a library collection item\*, 2014/2015

Mildura 19.00%

Victoria 18.46%

\*indicator includes ebooks from 2015/16 onwards, which may affect a council's variance from 2014/15

## Domain 4: Victorians are connected to culture and community

### Outcome 4.1: Victorians are socially engaged and live in inclusive communities

#### INDICATOR - Increase access to social support

##### 4.12 Proportion of adults, by ability to get help from family (yes, definitely), 2014 Victorian Population Health Survey, DHHS (LGA) TL

Drawing on findings from the VPHS a lesser proportion of Mildura LGA adults were able 'to get help from family' (77.9%) than their Victorian counterparts (81.6%).

Proportion of adults, by ability to get help from family (yes, definitely), 2014

Mildura 77.9%

Victoria 81.6%

##### 4.13 Proportion of adults, by ability to get help from friends (yes, definitely), 2014 Victorian Population Health Survey, DHHS (LGA) TL

Drawing on findings from the VPHS a greater proportion of Mildura LGA adults were able 'to get help from friends' (83.4%) than their Victorian counterparts (79.7%).

Proportion of adults, by ability to get help from friends (yes, definitely), 2014

Mildura 83.4%

Victoria 79.7%

##### 4.14 Proportion of adults, by ability to get help from neighbours (yes, definitely), 2014 Victorian Population Health Survey, DHHS (LGA) TL

Drawing on findings from the VPHS a greater proportion of Mildura LGA adults were able 'to get help from neighbours' (55.0%) than their Victorian counterparts (51.2%).

Proportion of adults, by ability to get help from neighbours (yes, definitely), 2014

Mildura 55.0%

Victoria 51.2%

Source: Department of Health and Human Services 2017, Inequalities in the social determinants of health and what it means for the health of Victorians: findings from the 2014 Victorian Population Health Survey, State of Victoria, Melbourne.

<https://www2.health.vic.gov.au/public-health/population-health-systems/health-status-of-victorians/survey-data-and-reports/victorian-population-health-survey/victorian-population-health-survey-2014> Accessed 20/04/2017

#### 4.15 Perceptions of neighbourhood – people are willing to help each other, 2015, VicHealth Indicators Survey (LGA) TL

Social capital is an overarching term that refers to social connections and all the benefits they generate. It includes the concepts of trust, social connection and social cohesion. In relation to neighbourhoods, these elements of social capital are interconnected and have implications for mental wellbeing. Emerging research evidence suggests that neighbourhood cohesion impacts on mental health and wellbeing. The perception of being part of a cohesive neighbourhood can also counteract adverse health effects resulting from local socioeconomic disadvantage, although this association may vary according to context.

Mutual trust and solidarity among neighbours determines how much people are willing to cooperate and help one another, and is a core component of social capital. The perception of a neighbourhood being 'close-knit' (held tightly together through social and cultural ties) indicates high levels of neighbourhood trust and social cohesion. People who are connected and actively engaged in their local communities are more likely to feel positive about their neighbourhood, and vice versa. Neighbours who trust one another are more likely to work more effectively together for the collective advantage and, generally, to have higher life satisfaction.

Factors that could influence how a person feels about their neighbourhood include the physical, human and cultural characteristics of a place, as well as socioeconomic factors, age, ethnicity and the shared norms and values of the community. More broadly, living in communities that provide access to affordable housing, healthcare, education, stable employment and social connectedness can significantly improve our mental wellbeing. Social connections to clubs, schools, faith and interest groups have a positive influence on wellbeing, social cohesion and social capital (VicHealth, 2016).

Findings from the 2015 VicHealth Indicators Survey reveals a slightly greater proportion of Mildura LGA residents believe 'people are willing to help each other' (74.2%) than their Victorian peers (74.1%).

##### Perceptions of neighbourhood – people are willing to help each other, 2015

#### **Gender equality within relationships**

The ability to participate in equal and respectful relationships is an important contributing factor to mental health and wellbeing. Conversely, intimate partner violence is detrimental to physical and mental health. Male intimate partner violence contributes more to the disease burden for women aged 18 to 44 years than any other well-known risk factors like tobacco use, high cholesterol or use of illicit drugs. Throughout Australia, two in five women (40.8%) have experienced physical and/or sexual violence from men known to them; one in six (16.9%) by a current or previous cohabiting intimate partner, and one in ten (11.3%) by a boyfriend or date.

Exposure to partner violence has also been associated with an increased risk of a range of health problems including suicide, anxiety, depression and other mental health problems; substance misuse; and reproductive health problems such as low infant birth weight and sexually transmitted infection (VicHealth, 2016).

In Australia, the cost to society of violence against women and their children is \$21.7 billion annually. If no further action is taken to prevent violence against women and their children, costs will accumulate to over \$323 billion over the 30 years to 2045.

Violence against women is more likely to occur in contexts of unequal relationships between men and women or when there are more rigid distinctions enforced between the roles of men and women. Violence is also more common in families and relationships in which men control decision-making and less so in those relationships in which women have a greater level of agency.

In Australia and internationally, efforts to reduce the prevalence of violence against women involve a significant focus on the promotion and improvement of gender equality. Gender equality is defined as the equal treatment of women and men in laws and policies, and equal access to resources and services within families, communities and society. Addressing the social norms, social practices and social structures that produce and maintain gender inequality is a pivotal strategy to reduce violence and to increase equal and respectful relationships at every level.

The attitudes and beliefs held by the broader community about gender roles and relationships, and also the acceptability of intimate partner violence, have an important bearing on the prevalence of violence. Equally, community attitudes that favour equality and non-violence can contribute to the development of a society in which violence is less likely to occur. Attitudes toward gender equality within relationships are therefore an important measure of community support for respectful and equal relationships, which are a key protective factor for mental wellbeing (VicHealth, 2016).

#### 4.17 Low gender equality score\*, 2015, VicHealth Indicators Survey (LGA) TL

Positively less Mildura LGA residents (33.5%) had low gender equity scores than their Victorian counterparts (35.7%). Interestingly when analysed by gender 43.1% of Mildura LGA males and 24.7% of females had low gender equality scores.

#### 4.19 Satisfaction with life as a whole (range 0–10), 2015 VicHealth Indicators Survey (LGA) TL

Subjective wellbeing considers an individual's experience of their life, as well as a comparison of their life circumstances with social norms and values. Two wellbeing indicators are presented in the 2015 VicHealth Indicators Survey Mildura LGA Profile report. The first indicator is 'subjective wellbeing', which is assessed through the Personal Wellbeing Index (PWI). The second indicator is general life satisfaction, which is captured by asking about participants' 'satisfaction with life as a whole'. General life satisfaction measures how people evaluate their life as a whole, rather than their current feelings. When asked to rate their general satisfaction with life on a scale from 0 to 10, Australians gave it an average rating of 7.3, higher than the OECD average of 6.5 (VicHealth, 2016). Mildura LGA residents gave a rating of 7.8, equivalent to their Victorian peers.

#### 4.21 4.1.2.3 Proportion of adults who feel most adults can be trusted, Victoria Population Health Survey DHHS (LGA)

Research shows as total annual household income increases, the proportion of Victorian adults who reported that they do not feel safe walking alone down their street after dark and/or do not believe that most people can be trusted decreases. Therefore, social trust is associated with socioeconomic status; the lower the socioeconomic status the lower the level of social trust (DHHS, 2017).

Further to this the review of data collected through the Victorian Population Health Survey confirms that adults who do not feel safe walking alone down their street after dark and/or do not believe most people can be trusted are more likely to have high or very high psychological distress compared with their counterparts who did feel safe walking alone down their street after dark and/or do believe most people can be trusted. Therefore, social trust is associated with mental health; as social trust declines mental health declines. Additionally adults who do *not* feel safe walking alone down their street after dark and/or do *not* believe most people can be trusted are more likely to rate their overall health status as only fair or poor compared with their counterparts who do feel safe walking alone down their street after dark and/or do believe most people can be trusted (DHHS, 2017).

Findings from the 2014 Victorian Population Health Survey indicate less adults in the Mildura LGA feel 'most adults can be trusted – yes, definitely' (34.0%) than their Victorian counterparts (38.2%). More positively the proportion of the Mildura LGA who felt 'most adults can be trusted – yes, definitely' increased between 2014 (34.0%) and 2011 (31.9%).

#### 4.23 4.1.2.5 Proportion of adults who feel valued by society, 2014, Victoria Population Health Survey DHHS (LGA)

The Victorian Population Health Survey measured civic trust by asking survey respondents the following two questions: 'Do you feel valued by society?' and 'Do you feel there are opportunities to have a real say on issues that are important to you?' Civic trust is associated with socioeconomic status; the lower the socioeconomic status the lower the level of civic trust.

Research shows that adults who do not feel valued by society and/or do not feel there are opportunities to have a real say on matters that are important to them are significantly more likely to have high or very high psychological distress compared with their counterparts who do feel valued by society and/or do feel there are opportunities to have a real say on important matters. As civic trust declines mental health declines. Similarly, adults who do not feel valued by society and/or do not feel there are opportunities to have a real say on matters that are important to them are more likely to rate their overall health status as only fair or poor compared with their counterparts who do feel valued by society and/or do feel there are opportunities to have a real say on important matters. As civic trust declines physical health declines (DHHS, 2017).

Findings from the 2014 Victorian Population Health Survey indicate a greater proportion of adults in the Mildura LGA feel 'valued by society – yes, definitely' (54.8%) than their Victorian counterparts (51.4%).

##### Proportion of adults who feel valued by society (yes, definitely), 2014

#### 4.27 **Community engagement** Individuals isolated by language, 2016, ABS Census of Population and Housing (2017) (LGA and SA1) *(Section 5.1 2012 Social Indicators Report)*

The *2012 Social Indicators Report* asserts that the level of engagement within a community can be inferred, to some extent, by the proportion of its population born overseas who are isolated by language. In 2011, 15.5% of Mildura LGA residents experienced isolation due to English language barriers, by 2016 this had grown to 19.7%. In 2011 1.3% of Regional Victoria's population identifying as 'birthplace elsewhere' were isolated by language, by 2016 this had grown to 9.0%.

In comparison to Victoria the Mildura LGA had a higher proportion of 'birthplace elsewhere' residents isolated by language (19.7% compared to only 15.8% for Victoria). Within the Mildura LGA the SA1 Groupings within the highest proportion of individuals isolated by language were Koorlong / Cardross (31.0%), Mildura South (22.5%) and Mildura North (21.9%). The SA1 Groupings within the lowest proportion of individuals isolated by language (all 0.0%) were Nichols Point, Millewa, Ouyen / Walpeup and Mallee Track.

#### 4.28 Gaming machine losses (\$) usage per head of adult population, 2015, Victorian Commission for Gambling and Liquor Regulation, 2016, (LGA) TL

The Victorian Gambling Study, *A Longitudinal Study of gambling and public health - Wave Two Findings* (Department of Justice, 2011) found a number of variables were associated with the increased risk of 'transitioning' from a non-gambler/non-problem gambler to a low or moderate risk or problem gambler, including:

- poor general health
- poor psychological health
- past year smoking
- group households (with non-relatives)
- speaking a language other than English at home
- year 10 or lower education levels
- betting weekly or greater on horse, harness racing or greyhounds, and
- Troubles with work, boss or superiors and an increase in the number of arguments with someone close.

The study also found that males are significantly more likely to be problem gamblers or moderate risk gamblers than females. For males, those aged 25-34 years have the highest prevalence of problem gambling, followed by those aged 50-64 years. The 25-34 years age group also had the highest prevalence of problem gambling for females, along with the 35-49 year age group then closely followed by females aged 60-64 years. For both males and females, the lowest problem gambling prevalence was in the 65 years or older age group <https://exchange.murrayphn.org.au/north-west-victoria> Accessed 10/04/2017.

The Mildura LGA specific data presented below is captured, analysed and distributed by the Victorian Commission for Gambling and Liquor Regulation and the Victorian Responsible Gambling Foundation. The Victorian Commission for Gambling and Liquor Regulation (VCGLR) is the independent statutory authority that regulates Victoria's gambling and liquor industries. The Victorian Responsible Gambling Foundation helps people affected by problem gambling, as well as their families and friends. The foundation is responsible for fostering a greater understanding and awareness of the concept of responsible gambling in the wider community. (<https://www.vcglr.vic.gov.au/> and <https://www.responsiblegambling.vic.gov.au/>).

The Mildura LGA has a total of 285 'pokie machines' dispersed between eight venues across the municipality. In all \$25,711,760 was lost on pokie machines in the 2015/2016 financial year or an average loss per day of \$70,251 (almost \$500,000 per week). This equates to \$90,217 per machine. <https://www.responsiblegambling.vic.gov.au/information-and-resources/your-local-government-area> Accessed 23/06/2017.

#### Electronic Gaming Machine Expenditure, 2011/2012 – 2015/2016

	Player losses* 2011-12	Player losses 2012-13	% change	Player losses 2013-14	% change	Player losses 2014-15	% change	Player losses 2015-16	\$ change	% change
Rural City of Mildura	\$25,255,276	\$24,827,821	↓1.69%	\$24,700,237	↓0.51%	\$25,640,869	↑3.81%	\$25,711,760	\$70,891	↑0.28%

Victoria	\$2,681,451,715	\$2,490,488,907	↓7.12%	\$2,504,343,302	↑0.56%	\$2,571,926,031	↑2.70%	\$2,616,703,496	\$44,777,464	↑1.74%
----------	-----------------	-----------------	--------	-----------------	--------	-----------------	--------	-----------------	--------------	--------

(<https://www.vcglr.vic.gov.au/> and <https://www.responsiblegambling.vic.gov.au/> Accessed 20/06/2017).

\*Where player losses refer to all monies put in less 'winnings'. It is also sometimes referred to as gaming machine expenditure (by players) or gaming machine revenue (for the hotel or club). For example: A person walks into a gaming room with \$50, plays the machine for two hours and has some 'wins' along the way, and then cashes in their credit of \$10 from the machine. The person may have 'played' \$500 of credits on the machine and 'won' \$460 of credits but they have lost \$40 in money from that gaming session.

Importantly the expenditure decrease between 2011-12 and 2012-13 was due to the banning of ATMs in Victorian gaming venues which commenced on 1 July 2012, and the changes in pokies ownership from the two gaming operators (Tabcorp and Tatts) to individual gaming venues, which commenced on 16 August 2012. Since these changes EGM (pokies) expenditure has increased gradually across Victoria and, to a lesser extent, Mildura.

Data collected and analysed by the Victorian Commission for Gambling and Liquor Regulation and the Victorian Responsible Gambling Foundation reveal the Mildura LGA averaged \$634.61 in Gaming machine losses per head of adult population in 2015/2016, more than their Victorian counterparts (\$553.13) achieving a rank of 32<sup>nd</sup> of 79 Victorian LGAs.

## Domain 4: Victorians are connected to culture and community

### Outcome 4.2: Victorians can safely identify with their culture and identity

#### INDICATOR - Increase tolerance of diversity

4.29 **4.2.1.1** Proportion of adults who thought multiculturalism definitely made life in their area better, 2014, Victoria Population Health Survey DHHS (LGA)

Tolerance of diversity is essential for a socially cohesive society. The 2014 Victorian Population Health Survey found that 55% of Victorian adults definitely agree that multiculturalism makes life in their area better and 25% sometimes agree, however 9% of Victorian adults do not believe that multiculturalism makes their life better. Men, people 55 years of age or older, people of low socioeconomic status and those who live in rural Victoria were more likely to be intolerant of diversity.

Victorian adults who are intolerant of diversity are more likely to have high or very high levels of psychological distress than those who are tolerant of diversity. Furthermore Victorian adults who are intolerant of diversity are more likely to report being in fair or poor health than those who are tolerant of diversity. Therefore, intolerance of diversity is associated with both poorer mental health and poorer physical health (DHHS, 2017).

Of note adults living in the Mildura LGA were significantly more likely (18.2%) than all Victorian adults (9.0%) to disagree that multiculturalism makes life in their area better, suggesting that intolerance of diversity is a problem. More positively, the proportion of Mildura LGA adults who believed 'multiculturalism definitely made life in their area better' increased between the 2011 and 2014 VPHS reporting periods.

Proportion of adults who thought multiculturalism definitely made life in their area better, 2014

#### 4.30 Community acceptance of diverse cultures, 2011, VicHealth Indicators (LGA) TL / R

Mirroring the 2014 Victorian Population Health Survey findings the findings from the 2011 VicHealth Indicators Survey also indicate less tolerance of diverse cultures in the Mildura LGA with only 35.4% of the Mildura LGA indicating 'acceptance of diverse cultures' compared to 50.6% of their Victorian peers, achieving a rank of 73<sup>rd</sup> from the 79 Victorian LGAs.

4.31 **Community engagement** Profile of group, Characteristics of New Arrivals (country, religion, language), 2016, ABS Census of Population and Housing (2017) (LGA) *(Table 5.2, 2012 Social Indicators Report)*

As was the case in 2011 India was again the most prevalent 'Country of Birth' providing 14.6% of all new arrivals (between 2006 and August 2016), up slightly from 14.2% in 2011. Also as for 2011 Afghanistan was the second most prevalent 'Country of Birth' with 11.5% of new arrivals in 2016 reporting compared to 11.1% as reported in the 2012 Social Indicators Report.

The proportion of new arrivals indicating No Religion increased from 19.0% in 2011 to 20.4% in 2016. The most prevalent Religion reported was once again Islam, up from 19.0% in 2011 to 19.9% in 2016.

Interestingly for Language reported by new arrivals, whilst English remained most prevalent it dropped from 31.3% in 2011 to 20.6% in 2016. In contrast Hazaraghi grew from 5.1% in 2011 to 9.9% in 2016. The proportion of new arrivals stating Mandarin as their language more than doubled from 4.2% in 2011 to 9.9% in 2016 and Dari almost halved from 4.6% in 2011 to 2.5% in 2016.

Characteristics of New Arrivals to Mildura LGA (arriving between 2006 and August 2016), 2016

Country of Birth		Religion		Language

#### 4.32 **Community engagement** Education of New Arrivals 2016, ABS Census of Population and Housing (2017) (LGA) *(Table 5.3, 2012 Social Indicators Report)*

As was reported in the *2012 Social Indicators Report* the majority of new arrivals to the Mildura LGA do not have a 'non-school qualification' having indicated 'not applicable' (56.3%) on their Census of Population and Housing survey. Note the 'not applicable' option also includes 'Persons who have a qualification that is out of scope of this classification', 'Persons with no qualification', 'Persons still studying for a first qualification', and 'Persons aged under 15 years'.

Between 2006 and 2015 5.8% of New Arrivals identified as having a Post Graduate Degree level qualification compared to only 4.0% of those who arrived between the 2006 and 2011 Census periods. Similarly 10.5% of New Arrivals held an Advanced Diploma and Diploma Level qualification compared to only 9.6% of those who arrived between the 2006 and 2011 Census periods.

In contrast only 16.4% of New Arrivals between 2006 and 2015 identified as holding a Bachelor Degree Level qualification compared to 20.8% of those who arrived between the 2006 and 2011 Census periods. Similarly 9.8% of New Arrivals held a Certificate Level qualification compared to 11.1% of those who arrived between the 2006 and 2011 Census periods.

4.33 New settler arrivals per 100,000 population, 2014/2015 Settlement Database, Department of Social Services, (LGA) TL / R

During 2014/2015 there were 258.3 new settler arrivals per 100,000 population in the Mildura LGA Mildura, less than half the Victorian rate of 682.5 per 100,000. There were sharply declining numbers of new settler arrivals occurring in the Mildura LGA by 2014/2015 LGA with Mildura ranked 29<sup>th</sup> amongst 79 LGAs.

New settler arrivals per 100,000 population, 2014/2015

According to the United Nations' High Commission for Refugees, the level of human displacement is the highest on record, with 51.2 million people counted as refugees, asylum seekers or internally displaced people in 2013. Forced displacement is primarily a result of persecution, conflict, and generalised violence, including sexual violence and/or human rights violations. Prolonged periods in refugee camps, experiences of war, the effects of torture and trauma, loss of or separation from family members, and dangerous journeys to Australia are among the highly traumatic experiences that differentiate refugees from most other migrants to Australia and impact greatly on their health and wellbeing (DHHS, 2015).

#### 4.34 Humanitarian arrivals as a percentage of new settlers 2014/2015 Settlement Database, Department of Social Services, (LGA) TL / R

Despite lower rates of new settlers in the Mildura LGA (as reported above) the proportion of new settlers identified as Humanitarian arrivals was significantly higher (42.3%) than the Victorian level (9.3%) achieving the Mildura LGA a rank of 5<sup>th</sup> amongst the 79 Victorian LGAs. Furthermore the proportion of new settlers identified as Humanitarian arrivals had increased significantly between reporting periods.

##### Humanitarian arrivals as a percentage of new settlers, 2014/2015

## Domain 5: Victoria is liveable

### Outcome 5.1: Victorians belong to resilient and liveable communities

#### INDICATOR – Increase neighbourhood liveability

##### 5.1 **Community engagement** Social cohesion, Volunteering, 2016 ABS Census (LGA and SA1) TL *(Table 5.4: Volunteering, 2012 Social Indicators Report)*

Drawing on 2016 ABS Census data reveals a higher proportion of Mildura LGA residents aged 15 years and over are volunteering (20.7%) than their Victorian counterparts (19.2%).

The 2016 ABS Census of Population and Housing data reveals continuing trends between the 2011 and 2016 reporting periods as seen between the 2006 and 2011 reporting periods. For example:

- The Mildura LGA is volunteering at higher rates than their Melbourne counterparts (20.7% volunteering across the Mildura LGA compared to only 17.6% in Melbourne) yet lesser rates than their Regional Victorian counterparts (20.7% volunteering across the Mildura LGA compared to 24.3% across Regional Victoria).
- Within the Mildura LGA two SA1 groupings continue to show the highest rates of volunteerism – Mallee Track (47.5% of people volunteering, down slightly from 47.9% in 2011) and Ouyen / Walpeup (41.2% of people volunteering, up slightly from 39.9% in 2011)
- Within the Mildura LGA the Mildura North and South SA1 groupings show the lowest rates of volunteerism – 18.4% and 18.5% of people volunteering respectively, increasing slightly from the 'Mildura' grouping of 2011 (17.9%).
- A notable change was within the Nangiloc / Colignan SA1 Grouping which saw a decreased volunteering rate from 24.2% in 2011 down to only 18.5% in 2016.

##### Voluntary Work for an Organisation or Group, Count of persons aged 15 years and over, 2016

SA1 Grouping*	Not a volunteer	Volunteer	Not stated	Total

Volunteering, 2016 (*Figure 5.2, 2012 Social Indicators Report*)

5.2 **Community engagement** Social cohesion, Unpaid assistance to a Person with a Disability, 2016 ABS Census (SA1) *(Table 5.3: Unpaid Assistance, 2012 Social Indicators Report)*

Drawing on 2016 ABS Census data reveals a higher proportion of Mildura LGA residents aged 15 years and over are providing unpaid assistance to a person with a disability (12.1%, down slightly from 12.2% in 2011) than their Victorian counterparts (11.6%), yet a lesser proportion than their Regional Victorian counterparts (12.5%).

Similar to 2011 data presented in the *2012 Social Indicators Report* the communities within the Mildura LGA displayed relatively less variation in the level of unpaid assistance provided to residents with disability than was witnessed for the volunteering indicator. In 2011 unpaid assistance provided to residents with a disability ranged from a low of 9.8% in the SA1 Grouping of Nangiloc / Colignan to a high of 14.3% in Merbein. In 2016 unpaid assistance provided to residents with disability ranged from a low of 10.6%, again in the SA1 Grouping of Nangiloc / Colignan, to a high of 15.4% in Millewa. Once again higher levels of 'not stated' were a feature of the Nangiloc / Colignan SA1 Grouping results.

Unpaid Assistance to a Person with a Disability, Count of persons aged 15 years and over, 2016

Unpaid Assistance, 2016 (*Figure 5.3, 2012 Social Indicators Report*)

## Domain 5: Victoria is liveable

### Outcome 5.1: Victorians belong to resilient and liveable communities

#### INDICATOR – Increase adaptation to the impacts of climate change

*“Heatwaves cause more deaths in Australia each year than any other natural disaster, and have a greater negative impact on population health than any other natural hazard” (Atkins, 2013).*

Heatwaves are typically described as a minimum temperature over a prescribed duration that is likely to impact on the health of the community (Department of Human Services, 2009). Victoria has established a heat health alert which is issued when a predetermined threshold is reached. Mildura Municipality threshold is set at 34C. It is an average calculated by the predicted minimum and maximum temperatures (Mildura Rural City Council, 2015).

An increased risk of suffering heat related illness or death is generally due to the body’s inability to cool effectively or inability to continue to cool at a rate greater than heat is produced. There are a number of people within our communities whom are at an increased risk of adverse effects during heatwaves, including the elderly, children under 5, persons with certain pre-existing medical conditions, people with lack of capacity to keep themselves cool and persons not acclimatised to the regions level of heat (Mildura Rural City Council, 2015).

Climate change plays a role in heatwaves and it is predicted that as climate change continues, heatwaves will increase in frequency, intensity and duration. Research undertaken for the Victorian Department of Natural Resources and Environment by the Climate Impact Group at CSIRO suggests that the ‘projected average number of summer days over 35°C at Mildura centre for 2030 and 2070’ will climb from the current 23 days to 24-33 days in 2030 and 27-56 days in 2070 (Whetton, et al. 2002).

A combination of the effects of climate change added with an aging population and increased chronic disease results in increasing vulnerability within the community (Victorian Auditor General, 2014).

RETIRED 5.1.2.1 Excess death during extreme heat and heatwaves, Causes of Death ABS (regions)

## Domain 5: Victoria is liveable

### Outcome 5.2: Victorians have access to sustainable built and natural environments

#### INDICATOR – Increase environmental sustainability and quality

##### 5.3 Kilowatts of Solar installed (Community), 2015-2016, PowerCor (LGA)

###### Kilowatts of Solar installed by Community, 2015-2016

Mildura 11,843

Time Trend – in 2013-2014 the community had installed 7,616 kilowatts of solar, this had increased to 11,843 kilowatts in 2015-2016, a cumulative difference of 4,227 kilowatts.

5.5 **5.2.1.4** Proportion of the population with reticulated drinking water that complies with the *E. coli* water quality standard, 2015/2016, Annual report on drinking water quality in Victoria Department of Health and Human Services (water sampling locality)

*Escherichia coli* (also known as *E. coli*) is a type of faecal coliform bacteria. The presence of *E. coli* is an indicator of the presence of contamination from human or animal waste. Its presence most likely indicates a breach of a water quality treatment barrier or contamination during the distribution of the water, and is used as an indicator for the presence of microbial pathogens.

The *Safe Drinking Water Act 2003* regulates the quality of drinking water supplies. It places obligations on water suppliers and water storage managers to provide safe, good-quality drinking water (DHHS, 2017b).

Under section 22 of the *Safe Drinking Water Act 2003*, water agency and council officers are required to immediately report to the department if they believe, or suspect on reasonable grounds, that water supplied, or to be supplied, for drinking:

- may cause an illness
- may transmit an illness
- may contain a pathogen, substance, chemical or blue-green algae toxin, alone or in combination, at levels that may pose a risk to human health
- may cause widespread public complaint.

The Safe Drinking Water Regulations 2015 were made under s. 56 of the *Safe Drinking Water Act 2003* and came into operation on 18 July 2015 replacing the 2005 Regulations. The Regulations 2005 required that 98% of drinking water samples be free of *E. coli* (where each water locality must take one water sample per week). The drinking water quality standard in the Regulations 2015 has been strengthened by requiring all drinking water samples to be free of *E. coli*, with the exception of any false-positive sample.

Following any *E. coli* detection, water agencies are required to undertake a thorough investigation to determine if the result is representative of the drinking water in the water sampling locality. The intent is to create a consistent and thorough approach to *E. coli* investigations across Victoria to identify failures and avoid contamination of drinking water supplies; this investigation does not replace or delay immediate response or corrective actions (DHHS, 2017b).

Two water suppliers provide drinking water to residents of the Mildura LGA, Lower Murray Water and Grampians Wimmera Mallee Water. Neither supplier provides water only to Mildura LGA residents (i.e. their supply area extends outside the Mildura LGA boundary).

There are six water sampling localities within the Mildura LGA: Ouyen (GWMWater), Underbool (GWMWater), Irymple (Lower Murray Water), Merbein (Lower Murray Water), Mildura (Lower Murray Water) and Red Cliffs (Lower Murray Water).

In **2013/2014** no water sampling localities within the Mildura LGA were identified by the Department of Health and Human Services (Annual Report on Drinking Water Quality in Victoria, 2013-14, DHHS) as not meeting drinking water quality standards regarding *E. coli*.

In **2014/2015** no water sampling localities within the Mildura LGA were identified by the Department of Health and Human Services (Annual Report on Drinking Water Quality in Victoria, 2014-15, DHHS) as not meeting drinking water quality standards regarding E. coli.

In **2015/2016** no water sampling localities within the Mildura LGA were identified by the Department of Health and Human Services (Annual Report on Drinking Water Quality in Victoria, 2015-16, DHHS) as not meeting drinking water quality standards regarding E. coli.

## 5.8 Environmental indicators Waste management, Community water usage, 2015/2016, Lower Murray Water (LGA, Mildura, Red Cliffs, Robinvale) (Section 10.2 2012 Social Indicators Report)

Review of community water usage for both residential and non-residential areas within the Mildura LGA shows universal increases from the 2012 data presented in the 2012 Social Indicators Report. For example the Mildura Area and Mildura LGA both increased residential usage from 0.41 in 2012 to 0.53 in 2015/16 (for Mildura Area) and from 0.40 in 2012 to 0.52 in 2015/2016 for Mildura LGA. The largest increase were witnessed in the non-residential water usage, with the Mildura LGA increasing from 0.94 in 2012 to 1.36 in 2015/2016.

### Water Use (ML per assessment), Residential and Non-Residential – 2015/16

Area	Units	Residential	Non-Residential
Mildura	ML per assessment	0.53	1.23
Red Cliffs	ML per assessment	0.46	3.04
Robinvale	ML per assessment	0.51	1.01
MRCC	ML per assessment	0.52	1.36

Note: Mildura includes Merbein and Irymple. Robinvale not included in the MRCC total.

Source: Lower Murray Water commissioned data (June, 2017)

## 5.9 Household Water Conservation rates, 2011, VicHealth Indicators Survey 2011 (LGA) TL

Household Water Conservation was measured in the 2011 VicHealth Indicators Survey. Respondents were asked if their household had engaged in a list of water conservation methods, including the collection of waste water from washing machines, showers or sinks.

Findings from the 2011 VicHealth Indicators Survey reveal higher levels of household water conservation in the Mildura LGA (49.0%) than witness across Victoria more broadly (41.3%).

### Household Water Conservation, 2011

Mildura 49.0%

Victoria 41.3%

#### 5.10 **Environmental indicators** Community energy usage, Powercor Australia Ltd (2017), (LGA) *(Section 10.3 2012 Social Indicators Report)*

In the *2012 Social Indicators Report* two measures were reported against 'Community energy usage' for the financial years 2006/07 to 2010/11. The first of these measures was 'Energy Use (Mwh) per Economic Activity (GVA)' by the industrial, commercial and agricultural sectors and second 'Domestic Energy Use (Mwh) per Capita'.

This same data was commissioned from Powercor for the financial years 2011/12 to 2016/17. Powercor advised that the collection of this data changed significantly in 2013 when Powercor moved to utilising actual data from smart meters (AMI metering) stored and analysed through SAP HANA.

##### *Smart meters or AMI metering*

The smart meter program (sometimes called the Advanced Metering Infrastructure or AMI program) was initiated by the Victorian Government in 2006. It has since been reviewed and enhanced by successive Governments, most recently in 2011. The smart meter roll-out, with smart meters replacing analogue meters in all Victorian homes and small and medium sized businesses, began in October 2009 and was completed in 2013.

Advanced metering infrastructure (AMI) is a composite technology composed of several elements: consumption meters, a two-way communications channel and a data repository (meter data management). Jointly, they support all phases of the meter data life cycle — from data acquisition to final provisioning of energy consumption information to end customers. Within the energy sector smart meters record electricity usage every 30 minutes and automatically send this data to your electricity distributor, who will pass it to your electricity retailer.

Source: <http://www.gartner.com/it-glossary/advanced-metering-infrastructure-ami> accessed 19/07/2017

<https://www.powercor.com.au/our-services/smart-meters/how-smart-meters-work/> accessed 19/10/2017

##### *SAP HANA*

SAP HANA is an in-memory, column-oriented, relational database management system developed and marketed by SAP SE. Its primary function as a database server is to store and retrieve data as requested by the applications. In addition, it performs advanced analytics (predictive analytics, spatial data processing, text analytics, text search, streaming analytics, graph data processing) and includes ETL (Extract, Transform, Load) capabilities as well as an application server.

Source: <https://www.sap.com/australia/products/hana.html#> accessed 19/10/2017

RETIRED MEASURE **Environmental indicators** Vegetation cover

5.11 **Environmental indicators** Land management practices, Irrigation Methods for permanent plantings (by Area, ha), 2015, SunRISE (2015) (LGA) (*Table 10.8 2012 Social Indicators Report*)

In the *2012 Social Indicators Report* it was noted: “Environmental land management practices are becoming more commonplace within the region. This is evidenced by the increasing use of drip irrigation methods as well as the significant increase in the area of local agricultural land, which is covered by an Environmental Management Plan” (p.70).

Two measures were reported to support this comment, the Area of Agricultural Land with Environmental Management Plans and the Prominence of Irrigation Methods (by Area, ha). In discussion with Mildura Rural City Council the measure regarding the Area of Agricultural Land with Environmental Management Plans was removed from Social Indicators reporting on the basis the data for this measure was not accurately captured, Council staff added that the data for this measure presented in the 2012 report was almost certainly incorrect.

The second measure, the Prominence of Irrigation Methods (by Area, ha), was revised for this report (and should be for reports ongoing). In the *2012 Social Indicators Report* this measure presented data for the Victorian Murray-Mallee Region, a region significantly larger than the Mildura LGA (drawn from the Mallee Catchment Management Authority *2012 Mallee Horticulture Crop Report*). In the table below this data is presented for the Mildura LGA only and should be used in place of data presented in earlier Social Indicators Reports. This data is drawn from the report compiled for Mildura Rural City Council by SunRISE Mapping and Research, a division of Mallee Family Care Incorporated, completed in May 2016 with figures from 1997 to 2015.

The data collated and presented by SunRISE Mapping and Research for the Mildura LGA reveals an overall decrease in irrigated permanent plantings of 110 ha from 21,135 ha in 1997 to 21,025 ha in 2015 (with a peak of 24,505 ha in 2003).

The most significant change from 1997 to 2015 was in irrigation method. In 1997 drip irrigation formed only 13% of all irrigation methods (or 2,725 ha of a total of 21,135 ha), by 2015 this proportion had increased to 67% (or 14,115 ha of a total of 21,025 ha) an increase of 11,390 ha between 1997 and 2015. By contrast surface irrigation decreased from 36% of all irrigation methods (or 7,675 ha of a total of 21,135 ha) in 1997 to only 4% of all irrigation methods in 2015 (or 745 ha of a total of 21,025 ha) an overall decrease of 6,930 ha. Overhead irrigation decreased by 5,830 ha during the same time period.

IRRIGATION METHODS FOR PERMANENT PLANTINGS (BY AREA, HA), 1997-2015

### 5.12 Household Waste Recycling rates, 2011, Sustainability Victoria reported in Community Indicators Victoria, 2011 (LGA)

Data on Household Waste Recycling are obtained from an annual survey conducted by Sustainability Victoria which collects information on the kerbside service activities provided by local government. This data reveals that Mildura LGA residents are recycling at less than half the rate of their Victorian counterparts (22.4% versus 45.0%).

#### Household Waste Recycling rates, 2011

Mildura 22.4%

Victoria 45.0%

[http://www.communityindicators.net.au/wellbeing\\_reports/mildura](http://www.communityindicators.net.au/wellbeing_reports/mildura) Accessed 29/04/2017

### 5.13 Kerbside collection waste diverted from landfill, 2015/2016, Department of Environment, Land, Water and Planning (LGA) TL

Data collected by the Department of Environment, Land, Water and Planning regarding 'kerbside collection waste diverted from landfill' during 2015/2016 indicates this is occurring across the Mildura LGA at 32.99% compared to Victoria at 42.92%.

#### Percentage of garbage, recyclables and green organics collected from kerbside bins that is diverted from landfill, 2015/2016

Mildura 32.99%

Victoria 42.92%

Time Trend proportion of kerbside waste diverted from landfill remaining stable between 2014/2015 and 2015/2016 ↓

#### Percentage of garbage, recyclables and green organics collected from kerbside bins that is diverted from landfill, 2014/2015

Mildura 33.00%

Victoria 40.86%

## Service Accessibility and Utilisation

### Outcome: Mildura LGA residents can access the services they require at the scale and time required

#### Indicator: services are accessible

##### S.1 Utilisation of selected health services per 1,000 population, 2014-15, Department of Health (LGA) TL / R

In 2014-2015 across the four service areas identified below (HACC clients aged less than 65 years, HACC clients aged 65 years plus, drug and alcohol clients and registered mental health clients) the Mildura LGA had higher service utilisation per 1,000 population than their Victorian counterparts. This was particularly so for registered mental health clients which was more than twice the Victorian rate (24.0 per 1,000 versus 11.9 per 1,000) achieving Mildura LGA a rank of 6<sup>th</sup> amongst the 79 Victorian LGAs on this measure.

Between the 2011-2012 and 2014-2015 reporting periods there was an increase in Mildura LGA drug and alcohol clients (10.9 per 1,000 up from 9.3 per 1,000) and a decrease in registered mental health clients 24.0 per 1,000 down slightly from 26.2 per 1,000). HACC client data cannot be compared due to changes in the reported age cohorts over the time periods.

##### Utilisation of selected health services per 1,000 population, 2014-15, Mildura

Area	HACC clients aged less than 65 years per 1,000 target population (rank)	HACC clients aged 65 years and over per 1,000 target population	Drug and alcohol clients per 1,000 population	Registered mental health clients per 1,000 population
<b>Mildura</b>	<b>366.9 (37)</b>	<b>931.0 (39)</b>	<b>10.9 (5) ↑</b>	<b>24.0 (6) ↓</b>

## S.3 Estimated number of people aged 18 years and over who experienced a barrier to accessing healthcare when needed it in the last 12 months, with main reason being cost of service (modelled estimates) (ASR per 100), 2014, Public Health Information Development Unit (2017) (LGA) TL

Based on modelled estimates calculated by PHIDU for the Social Health Atlas of Australia more Mildura LGA residents 'aged 18 years and over experienced a barrier to accessing healthcare when needed it in the last 12 months, with main reason being cost of service' than their Victorian peers (2.3 per 100 versus 1.6 per 100).

Estimated number of people aged 18 years and over who experienced a barrier to accessing healthcare when needed it in the last 12 months, with main reason being cost of service (modelled estimates) (ASR per 100), 2014

Mildura 2.3

Victoria 1.6

## APPENDIX 1 - Data Sources and Collection Tools

A broad range of data sources were drawn on in the development of the 2018 State of Mildura Rural City Report. In some instances the data source is also the agency that collected the data, for example the Australian Bureau of Statistics' using the Census of Population and Housing. On other occasions the data source is an agency or organisation that draws on and (often) undertakes analysis of data collected by other agencies. For example the Social Health Atlas, compiled by Public Health Information Development Unit, draws on and analyses data from a range of agencies to present a specific measure. For all measures presented in this report the data source, including the collection agency and analysing agency, are documented accordingly.

The main data collection agencies and their specific collection 'tools' are listed below.

**Australian Bureau of Statistics - 2016 Census of Population and Housing** The Census of Population and Housing (Census) is Australia's largest statistical collection undertaken by the Australian Bureau of Statistics (ABS). The aim of the Census is to accurately collect data on the key characteristics of people in Australia on Census night and the dwellings in which they live. The Census provides a comprehensive snapshot of Australia's people, their housing, and where they live. It offers information for small geographic areas and for small population groups, as well as for states, territories and the country as a whole.

The most recent Census of Population and Housing was undertaken in 2016, this data is presented throughout the report, with time trend data drawing on the 2011 Census data collection.

### **Department of Health and Human Services - Victorian Population Health Survey**

The Victorian Population Health Survey (VPHS) program was established in 1998 and collects information at the State, regional and local government area levels about the health, lifestyle and wellbeing of adult Victorians aged 18 years and over. The survey follows an established method to collect relevant, timely and valid health information which is applied to policy development and strategic planning.

Information is collected via computer assisted telephone interview on overall self-rated health status, level of psychological distress, body mass index (to determine weight status), the presence of chronic diseases, nutrition, physical activity, smoking and alcohol consumption. Information is also collected on participation in screening for bowel cancer, cervical cancer, breast cancer, high blood pressure, cholesterol and high blood sugar in addition to community participation, levels of social support and connections with others. Interviews are conducted in the major non-English languages in Victoria to ensure people of culturally and linguistically diverse backgrounds are represented.

The most recent VPHS data available at the LGA level is from the 2014 data collection. It is this 2014 data that is presented throughout this report, with time trend data drawing on the 2011-2012 VPHS data collection.

<https://www2.health.vic.gov.au/public-health/population-health-systems/health-status-of-victorians/survey-data-and-reports/victorian-population-health-survey>

Accessed 25/04/2017

**Department of Education and Training - Victorian Child Health and Wellbeing Survey** was first carried out in 2006 and again in 2009 and 2013 and will be repeated again later this year (2017). Five thousand telephone interviews were carried out in 2006 and 2009 increasing to 7,000 in 2013. Interviews are conducted with parents or carers of Victorian children aged from birth to 12 years. At each iteration, the survey is sampled at an Area level so results are only available at that geography. No reliable results are available at LGA level. As a result, throughout this report, results are presented for the Mallee Region. The results, which are made available through the VCAMS Portal, presented in this Report are for the 2013 survey findings.

#### **Department of Education and Training - Victorian Student Health & Wellbeing Survey (About You or VSHAWS)**

This online survey was implemented for the first time in 2014 in Victorian schools with Years 5, 8 and 11. About You collected important information about the health development, learning, safety and wellbeing of these children and young people and covers topics relating to nutrition, health, physical activity, safety, life satisfaction, and family relationships. It also includes direct height and weight measurement of students in a subsample of schools in order to provide state-wide estimates of overweight and obesity. The Survey (14,000 young people) was sampled at an Area level so results are only available at that geography. No reliable results are available at LGA level.

About You was most recently completed in 2016. These 2016 results have not yet been analysed as a result data reported through the VCAMS Portal is drawn from the 2014 About You Survey. It is this 2014 data presented in the State of Mildura Rural City Report.

#### **Department of Education and Training - On Track**

On Track is a large-scale survey designed to monitor the destination outcomes of Year 12 or equivalent completers and early school leavers six months after leaving school. This information provides insights into post-school destinations and pathways, and highlights the diversity of pathways young people pursue after leaving secondary school. The On Track survey involves students from all Victorian school sectors.

Consent to participate in the On Track surveys is required to enable the Department to contact school leavers. Consent is sought via a question on the students' Victorian Curriculum Assessment and Authority (VCAA) enrolment form completed when a student enrolls in a senior secondary unit. Students who consent to participate in the survey are contacted six months after leaving school. Participation in the survey is voluntary and school leavers may opt-out of completing the survey when contacted.

Year 12 or equivalent completers are defined as those who completed a Victorian Certificate of Education (VCE), International Baccalaureate (IB) or Victorian Certificate of Applied Learning (VCAL, Senior or Intermediate). The sample includes those who completed such qualifications in schools, or in TAFE institutions, or Adult and Community Education providers. <http://www.education.vic.gov.au/about/research/pages/ontrack.aspx> Accessed 09/05/2017.

Data drawn from the 2015 On Track Survey is utilised in this report.

**The Social Research Centre (ANU) - The Middle Years Development Instrument (MDI)** is a self-report questionnaire that asks children in Grade 4 and Grade 7 about their thoughts, feelings and experiences in school and in the community. The MDI is a comprehensive population-based measure that helps gain a deeper understanding of children's health and well-being during middle childhood.

The MDI uses a strengths-based approach to assess five areas of development that are strongly linked to children's well-being, health and academic achievement. It focuses on highlighting the protective factors and assets that are known to support and optimise development in middle childhood. These areas are: *Social and Emotional Development*,

*Physical Health and Well-Being, Connectedness, Use of After-School Time and School Experiences.* Each of these dimensions is made up of several measures and each measure is made up of one or more questions. The results for key MDI measures are summarised by two indices:

The **Well-Being Index** consists of measures relating to children's physical health and social and emotional development that are of critical importance during the middle years: Optimism, Self-Esteem, Happiness, Absence of Sadness and General Health.

The **Assets Index** consists of measures of key assets that help to promote children's positive development and well-being. Assets are resources and influences present in children's lives such as supportive relationships and enriching activities. The MDI measures four types of assets: Adult Relationships, Peer Relationships, Nutrition and Sleep, and After-School Activities.

Eleven school districts participated in the Grade 4 and Grade 7 2016 MDI trial, of which Mildura was one. For this reason comparison data to Victoria as a whole is not available. This report compares the Mildura school district results to all of the MDI data collected as part of the 2016 MDI Trial (reported as 'all participating Districts'). When making comparisons, it is important to consider the distribution of participating schools and school districts.

This report draws on the 2016 MDI data collection as reporting in the 2017 Middle Years Development Instrument Grade 4 and Grade 7 reports for the School District and Community of Mildura. [www.mdi.srcentre.com.au](http://www.mdi.srcentre.com.au)

#### **Department of Health & Human Services - Victorian Admitted Episodes Dataset**

The Victorian Admitted Episodes Dataset (VAED) provides a comprehensive dataset of the causes, effects and nature of illness, and the use of health services in Victoria. The VAED supports health service planning, policy formulation, epidemiological research and public hospital funding under the casemix system. All Victorian public and private hospitals, including rehabilitation centres, extended care

<https://www2.health.vic.gov.au/hospitals-and-health-services/data-reporting/health-data-standards-systems/data-collections/vaed> Accessed 27/04/2017

Data drawn from various Victorian Admitted Episodes Datasets are utilised in this report.

#### **VicHealth Indicators survey**

The *VicHealth Indicators Survey* is a Victorian-focused population level survey. The survey was first undertaken in 2007 (as *Community Indicators Victoria*) and again in 2011 as 'VicHealth Indicators'. The focus of the survey is on the social determinants of health, rather than health outcomes and as such is based on core questions related to individual and community health and wellbeing, critical to inform decisions about public health priorities. The aim of the survey is to provide information at a Local Government Area level to assist with the development of Municipal Public Health and Wellbeing Plans. The 2007 CIV data is no longer accessible online without being specifically commissioned so in some instances Time Trends cannot be presented. The *VicHealth Indicators Survey* compliments other Victorian population health surveys such as the *Victorian Government's Victorian Population Health Survey (VPHS)* and when combined, these two data sets enable local government planners to gain a comprehensive picture of health and wellbeing in Victoria. The survey is conducted by telephone interviews in each of Victoria's 79 LGAs, with a total sample of 22,819 participants aged 18 and over.

The VicHealth Indicators Survey 2015 includes 32 indicators across the areas of wellbeing, safety, mental wellbeing, gender equality in relationships, physical activity, healthy eating and alcohol. Several items in the VicHealth Indicators Survey 2015 were included in the Community Indicators Victoria Survey in 2007 and the VicHealth Indicators Survey 2011, allowing analysis of changes over time for these items.

Data drawn from the 2015 VicHealth Indicators Survey is utilised in this report.

Source: [https://www.google.com.au/?gws\\_rd=ssl#q=Mildura+LGA+Profile+vichealth+Indicators+survey+2015+results&\\*>](https://www.google.com.au/?gws_rd=ssl#q=Mildura+LGA+Profile+vichealth+Indicators+survey+2015+results&*>https://www.google.com.au/?gws_rd=ssl#q=Mildura+LGA+Profile+vichealth+Indicators+survey+2015+results&*>) Accessed: 13/03/2017

**Department of Education and Training - The School Entrant Health Questionnaire (SEHQ)** is a parent report instrument that records parent's concerns and observations about their child's health and wellbeing as they begin primary school in Victoria. The questionnaire was developed and piloted in 1996–97 as part of the Victorian School Nursing Redevelopment Program and has been distributed to parents and guardians of preparatory (Prep) grade children in Victorian primary schools since mid-1997. The intention of the questionnaire is to assist parents to identify health and wellbeing concerns; and provide nurses with a clinical tool to assess the health and wellbeing of each Prep grade child by providing detailed information on parental concerns. Findings from SEHQ analysis inform planning and service delivery of the Program.

Data drawn from the 2014 School Entrant Health Questionnaire is utilised in this report.

**Victoria Police - The Law Enforcement Assistance Program (LEAP)** online database is fully relational and stores information about all crimes brought to the notice of police as well as family incidents and missing persons. It also includes details on locations and persons involved. LEAP is a dynamic case management and data storage database designed primarily for operational policing purposes. Victoria Police update existing records with new information as it becomes available, and revise records when investigation identifies additional information. The Central Data Entry Bureau of Victoria Police also amends records when quality control checks identify inaccurate or incomplete information. Only the most serious offence which best describes a distinct course of criminal conduct is recorded in official crime statistics, even though an offender may be charged with other offences resulting from the one incident.

Police officers are required to complete a family violence report when they attend a family violence incident. Since 1 September 2004 police officers are also required to complete a family violence risk assessment report and these are available on LEAP from 9 December 2005.

Data drawn from the 2017 LEAP database is largely utilised in this report.

**VicRoads - CrashStats** provides access to road crash data to anyone who wants to better understand road safety trends in Victoria. VicRoads provides crash statistics to organisations, researchers and the general public to help with education, research and the development of road safety programs and initiatives.

**VicRoads - Road Crash Information System (RCIS)** Road Crash Information System (RCIS) is an online database providing crash data from Victorian road incidents dating back to 1987. This information is sourced from Victoria Police. RCIS also provides tools for analysing road crashes in Victoria. This data allows local government based road safety practitioners to better understand some of the key issues about road crashes and to tailor road safety initiatives for local communities. Access to RCIS is restricted due to the sensitive nature of the data. RCIS is available to state and local government road asset managers.

2011 - 2017 data drawn from the Road Crash Information System is utilised in this report.

Source: <https://www.vicroads.vic.gov.au/safety-and-road-rules/safety-statistics/crash-statistics> Accessed 10/04/2017

## APPENDIX 2 – Geographical Areas and Alignments

Measures within the 2018 State of Mildura Rural City Report are presented at various geographical levels depending on both data availability and what is most meaningful for planning purposes.

Most typically measures are reported at the *Local Government Area (LGA)* level with Victorian data used for comparison. In some instances ‘localised’ data is only available at the larger *Mallee Region* (this is particularly so for data from the Department of Education and Training). All other local data is presented at geographic levels smaller than the LGA including the Australian Bureau of Statistics defined geographies of SA2s and SA1s and the more broadly recognised geography of postcodes. Each are further explained below, with maps to depict scale, boundaries and overlaps.

Further to this, and drawing on the 2012 Social Indicators Report understanding, Melbourne refers to the Greater Capital City Statistical Area of Melbourne (GCCSA) covering 9,991 square kilometres of the Melbourne’s city and wider area and Regional Victoria refers to the remaining area within the State of Victoria which does not fall within the Melbourne Greater Capital City Statistical Area geography. Regional Victoria covers an area of approximately 217,505 square kilometres.

### Geographical Areas

The Australian Statistical Geography Standard (ASGS) is the geographical standard developed by the ABS for the collection and dissemination of geographic statistics. It is a hierarchically structured classification with a number of spatial units to satisfy different statistical purposes.

The two most left columns of the table below are the ‘areas’ defined within the Australian Statistical Geography Standard. Bolded are those geographical areas utilised in the measures contained within this report. In the far right column below are non-ABS defined regions which are typically understood and used in the presentation of data more generally (including by the ABS). Again the bolded headings indicate the geographical frameworks utilised in the measures contained within this report. Both are explained in more detail following the table.

The ASGS areas used for the Census are:		The following are non-ABS structures. These structures contain regions that the ABS does not define or maintain.
<ul style="list-style-type: none"> <li>▪ Mesh Block (MB);</li> <li>▪ <b><u>Statistical Area Level 1 (SA1);</u></b></li> <li>▪ <b><u>Statistical Area Level 2 (SA2);</u></b></li> <li>▪ Statistical Area Level 3 (SA3);</li> <li>▪ Statistical Area Level 4 (SA4);</li> <li>▪ <b><u>State/Territory (STE);</u></b></li> <li>▪ Australia (AUS);</li> <li>▪ <b><u>Greater Capital City Statistical Areas (GCCSA);</u></b></li> </ul>	<ul style="list-style-type: none"> <li>▪ Urban Centre/Locality (UC/L);</li> <li>▪ Section of State Range (SOSR);</li> <li>▪ Section of State (SOS);</li> <li>▪ Indigenous Location (ILOC);</li> <li>▪ Indigenous Area (IARE);</li> <li>▪ Indigenous Region (IREG);</li> <li>▪ Significant Urban Areas (SUA); and</li> <li>▪ Remoteness Area (RA).</li> </ul>	<ul style="list-style-type: none"> <li>▪ <b><u>Local Government Area (LGA);</u></b></li> <li>▪ <b><u>Postal Areas (POA);</u></b></li> <li>▪ Commonwealth Electoral Division (CED);</li> <li>▪ State Electoral Division (SED);</li> <li>▪ <b><u>State Suburb (SSC);</u></b></li> <li>▪ Natural Resource Management Regions (NRMR);</li> <li>▪ Australian Drainage Divisions (ADD); and</li> <li>▪ Tourism Regions (TR).</li> </ul>

**Statistical Area Level 1 (SA1)** The Statistical Area Level 1 (SA1) is the second smallest geographic area defined in the Australian Statistical Geography Standard (ASGS), the smallest being Mesh Block. The SA1 has been designed for use in the Census of Population and Housing as the smallest unit for the processing and release of Census data. Most SA1s have a population of between 200 to 800 persons with an average population of approximately 400 persons. This is to optimise the balance between spatial detail and the ability to cross classify Census variables without the resulting counts becoming too small for use. SA1s aim to separate out areas with different geographic characteristics within Suburb and Locality boundaries. In rural areas they often combine related Locality boundaries. SA1s are aggregations of Mesh Blocks. An SA1 is represented by a unique seven digit code (no SA1s are allocated a name).

SA1s are designed to remain relatively constant over several Censuses. Future change will largely be dealt with by splitting existing SA1s. SA1s cover the whole of Australia with no gaps or overlaps.

Based on 2016 Census of Population and Housing data there are 144 SA1 defined areas within the Mildura LGA. Much of the data presented in the previous 2012 Social Indicators Report was presented at the 'grouped' SA1 level. These SA1 'groupings' are detailed later in this Appendix, together with their correlation to SA2s. Additional to this a small number of these SA1s are discussed in relation to SEIFA disadvantage data where this level of area specific data can be useful in identifying specific geographical 'pockets' of disadvantage.

**Statistical Area Level 2 (SA2)** The Statistical Area Level 2 (SA2) is an area defined in the Australian Statistical Geography Standard (ASGS), and consisting of one or more whole Statistical Areas Level 1 (SA1s). Wherever possible SA2s are based on officially gazetted State suburbs and localities. In urban areas SA2s largely conform to whole suburbs and combinations of whole suburbs, while in rural areas they define functional zones of social and economic links. Geography is also taken into account in SA2 design.

SA2 CODE 2011/2016	SA2 NAME 2011	SA2 NAME 2016
215021395	Irymple	Irymple
215021396	Merbein	Merbein
215021469	Mildura	Mildura North
215021470	(215021397)	Mildura South
215021398	Mildura Region	Mildura Region
215021399	Red Cliffs	Red Cliffs

The SA2 is the smallest area for the release of many ABS statistics, including the Estimated Resident Population (ERP), Health & Vitals and Building Approvals data. SA2s generally have a population range of 3,000 to 25,000 persons, and have an average population of about 10,000 persons. SA2s are aggregations of whole SA1s. SA2s cover, in aggregate, the whole of Australia without gaps or overlaps. Within the Mildura LGA there are now six SA2 defined areas (shown right) up from five SA2s in the 2011 Census. Two additional SA2 areas are presented in the *2018 State of Mildura Rural City Report*, the Wentworth-Buronga SA2 which captures the NSW border communities along the Murray River and the Robinvale SA2.

SA2 MAPS here – draw from 2014 State of the Children report. Note Mildura SA2 is now Mildura North and Mildura South SA2

**Greater Capital City Statistical Area Structure** Greater Capital City Statistical Areas (GCCSAs) are designed to represent the functional extent of each of the eight State and Territory capital cities. They include the people who regularly socialise, shop or work within the city, but live in the small towns and rural areas surrounding the city. GCCSAs are not bound by a minimum population size criterion. GCCSAs are built from SA4s. Within the State of Mildura Rural City Report two GCCSAs are applied – 'Greater Melbourne' and 'Rest of Victoria' referred to as Melbourne and Regional Victoria respectively.

'Greater Melbourne' and 'Rest of Victoria' map here

**State/Territory (STE)** The State/Territory is the largest spatial unit in the Australian Statistical Geography Standard (ASGS). There are six states and five territories in the ASGS: New South Wales, Victoria, Queensland, South Australia, Western Australia, Tasmania, Northern Territory, Australian Capital Territory, Jervis Bay Territory and the external Territories of Christmas Island and Cocos (Keeling) Islands. Jervis Bay Territory, and the Territories of Christmas Island and Cocos (Keeling) Islands are grouped as one spatial unit at the State/Territory level in the category of Other Territories. States/Territories consist of one or more Statistical Areas Level 4 (SA4s). In aggregate, they cover Australia without gaps or overlaps.

**Postal Areas (POA)** Postal Areas are ABS approximations of Australia Post postcodes, created by allocating whole Statistical Areas Level 1 (SA1s) on a 'best fit' basis to postcodes. Census Postal Areas exclude non-mappable Australia Post postcodes such as:

- post office box postcodes;
- some delivery route postcodes, which are also covered by other postcodes (a situation which often occurs in rural areas); and
- some postcodes which, because of the application of the 'best fit' principle, do not get an SA1 allocated to them.

Every SA1 is allocated one valid Australia Post postcode as the Postal Area for that SA1. When a person is enumerated in that SA1, the Postal Area is allocated to the person as their Postal Area of enumeration. When a person's address is coded to their SA1 of Usual Residence, the Postal Area of the SA1 is allocated to the person as their Postal Area of Usual Residence.

**State Suburb (SSC)** This is a Census-specific area where Statistical Areas Level 1 (SA1s) are aggregated to approximate suburbs. It is available for the whole of Australia, but in rural areas SSC poorly represent the gazetted localities. Note that the Statistical Areas Level 2 (SA2s) are aligned closely with suburbs in urban areas, however in this report multiple State Suburbs are combined to create the Regional Mildura SA2.

**Local Government Area (LGA)** A Local Government Area (LGA) is a geographical area under the responsibility of an incorporated local government council, or an incorporated Indigenous government council. The LGAs in Australia collectively cover only a part of Australia. The main areas not covered by LGAs are northern parts of South Australia, a large part of the Northern Territory, the western division of New South Wales, all of the Australian Capital Territory and the Other Territories. The number of LGAs and their boundaries can change over time. Their creation and delimitation is the responsibility of the respective state/territory governments, and are governed by the provisions of state/territory local government and other relevant Acts. The types of LGAs in Victoria are Cities (C), **Rural Cities (RC)** [in the case of Mildura], Boroughs (B) and Shires (S);

## Geographical Alignments

**Postcodes** Some measures within the State of Mildura Rural City Report require data to be presented at the postcode level and this data to be aggregated to provide data at the larger 'community' level and LGA level also. Some postcodes do not sit entirely within the Mildura LGA, for example the 3489 postcode attached to Tempy or the 3491 postcode attached to Patchewollock. The table below shows all postcodes sitting wholly or partially within the Mildura LGA.

POSTCODE	LGA CODE 2011	LGA NAME 2011	RATIO	PERCENTAGE (within LGA)
3489* (Tempy)	24780	Mildura (RC)	0.1666429	16.6642882
3490 (Ouyen) also includes: Boinka, Kulwin, Torrita and Tutye	24780	Mildura (RC)	0.9998638	99.9863757
3491* (Patchewollock)	24780	Mildura (RC)	0.2919316	29.1931567
3494 (Colignan and Nangiloc) also includes: Carwarp and Iraak	24780	Mildura (RC)	0.9998595	99.9859477
3496 (Millewa and Red Cliffs) also includes: Cullulleraine, Werrimull, Cardross, Meringur, Lindsay Point, Merrinee, Neds Corner	24780	Mildura (RC)	1.0	99.9999984
3498 (Irymple)	24780	Mildura (RC)	0.9994839	99.9483885
3500 (Mildura)	24780	Mildura (RC)	1.0	100.0
3501 (Nichols Point) also includes: Hattah, Koorlong and Mildura Centre Plaza	24780	Mildura (RC)	0.9814946	98.149457
3505 (Merbein) also includes: Yelta, Merbein South, Birdwoodton, Merbein West, Wargan, Cabarita,	24780	Mildura (RC)	0.999302	99.9301968
3506** (Cowangie)	24780	Mildura (RC)	1.0	100.0
3507 (Walpeup)	24780	Mildura (RC)	1.0	100.0
3509 (Underbool) also includes: Linga	24780	Mildura (RC)	1.0	100.0
3512 (Carina and Murrayville) also includes: Panitya	24780	Mildura (RC)	1.0	100.0
3533*** (Bimbourie)	24780	Mildura (RC)	0.0271612	2.7161168

### Outside of the Mildura LGA

Importantly Mildura's position on the border requires some analysis of the NSW (and other Victorian) communities which gravitate to Mildura for support and services. The NSW communities identified as significant in cross-border service utilisation include Buronga and Gol Gol, Dareton and Coomealla and Wentworth. The most significant Victorian community is the township and surrounds of Robinvale.

The Local Government Area (LGA) of Wentworth encompasses a number of communities, those with the greatest population density are along the western boundary (adjacent to the Murray River) and include Wentworth, Coomealla / Dareton, Buronga and Gol Gol. However the Shire also encompasses the communities of Curlwaa, Ellerslie, Pomona and Pooncarie. The Wentworth LGA covers an area of 26,256 square kms and has a population of 6,609 people. For the purposes of the State of Mildura Rural City Report the 'NSW Towns' SA1 Grouping was utilised (shown in the table above) this was a collective of 25 SA1s including all SA1s from the Wentworth Buronga SA2 and a further three SA1s from the Wentworth-Balranald SA2. Importantly where a measure required data to be presented at the SA2 level ONLY the Wentworth-Buronga SA2 alone was used. This geographical methodology reflects that used in the 2012 Social Indicators Report and replaces that used in the 2014 State of the Children Report.

The 2014 State of the Children Report collectively used the State Suburbs of Wentworth, Curlwaa, Coomealla and Dareton, and Gol Gol (which includes Buronga and the populated stretch between Buronga and Gol Gol) which, taken together, form the Wentworth-Buronga SA2.

#### Wentworth-Buronga SA2 and SS MAP here

For the purposes of the State of Mildura Rural City Report the geographical methodology for the Robinvale community also reflected the 2012 Social Indicators Report where the 'Robinvale' Grouping (again as shown in the table above) was a collective of 13 SA1s including all SA1s from the Robinvale SA2 and a further one SA1 from the Swan Hill Region SA2. Importantly where a measure required data to be presented at the SA2 level ONLY the Robinvale SA2 alone was used.

#### Robinvale SA2 MAP here

## Methodological explanations – ERP and Census populations used for rate calculations

### Rates Methodology

When calculating rates the following methodology was applied.

**Crime Rate per 1,000 inhabitants:** This represents the number of Index offenses per 1,000 inhabitants.

For example: What is the crime rate for a municipality with 513 Index offenses (murder, rape, robbery, aggravated assault, burglary, larceny-theft and motor vehicle theft), with a population of 8,280?

$513 \text{ (Index offenses)} \div 8,280 \text{ (population)} = .061957 \times 1,000 = 62.0 \text{ (crime per 1,000 inhabitants)}$

### Mildura LGA

Mildura LGA total population	2011*	2012	2013	2014	2015	2016*
Estimated Resident Population - Persons - Total (no.)	50,979	52,197	52,633	53,018	53,015	53,878
Victoria	5,354,042					5,926,624

\* note 2011 and 2016 count are based on actual Census of Population and Housing results, not estimates.

## Methodological explanations – age standardised rate calculations

Age-standardisation is a technique used to enhance the comparability of rates from different populations or different sub-populations over time by making adjustments for the confounding effects of differences in age structure between the populations being compared. The age-adjusted rates are rates that would have existed if the population under study had the same age distribution as the "standard" population. Therefore, they are summary measures adjusted for differences in age distributions.

The Australian Bureau of Statistics (ABS) and the Australian Institute of Health and Welfare (AIHW) have previously indicated that the standard population in Australia should be the Estimated Resident Population (Australia's official population estimate) for the years ending in '1' (e.g. 2001 and 2011) and that it should be updated every 10 years.

While following this advice has been accepted practice in Australia in recent years, it is important to note that neither demographic nor epidemiological methodology require the standard population to be updated this frequently. In fact, analysis recently undertaken by a joint ABS-AIHW working group demonstrated that the frequency of the change in the standard population resulted in negligible difference in the comparison of key indicators over time. As such the ABS and AIHW recommend that the standard population be revised every 25 years instead of every 10 years, which would reduce the frequency of revisions without reducing the effectiveness of age-standardised

comparisons. This would also align the revision cycle with what demographers generally consider to be the timespan of a generation.

To ensure that all age-standardisation is able to effectively reference the same standard population, the ABS has released the data cube '[Standard Population for Use in Age-Standardisation Table](#)' within [Australian Demographic Statistics](#) (cat. no. 3101.0), starting with the release on 20 June 2013. It is important to note that these data do not reflect the recasted series, but instead reflect the original final 30 June 2001 population that was published in 2003 and has been used in age-standardised analysis since then.

The ABS and AIHW recommend that the 30 June 2001 standard population in the data cube should be used for age-standardisation until a new standard population becomes available after the 2026 Census <http://www.abs.gov.au/ausstats/abs@.nsf/Lookup/3101.0Feature+Article1Mar%202013> accessed 24/11/2017

#### Methodology

An example of the computation of an age-adjusted death rate (AADR) follows:

The rate in the area of study (e.g. LGA, state) is computed for each age group noted in the table below by dividing the number of events (e.g. deaths, people with need for assistance) in that age group by the estimated population of the same age group in that area and then multiplying by a constant of 100,000. This results in an age-specific death rate (ASDR) per 100,000 population for each age group. That is, for each age group,  $ASDR = \text{deaths in age group} \div \text{estimated population of that age group} \times 100,000$ .

Each ASDR is then multiplied by the proportion of the standard population (see table below) that same age group. The age-specific results are summed to get the age-adjusted death rate for the area of study. The formula is:  $AADR = \text{Summation of } (ASDR \times \text{standard proportion})$
